## 1. Introduction

### 1.1. Overview

- 1.1.1. This report documents the tasks and outcomes from Stage 1 of the Mid Sussex Transport Study (2011-2012), which entailed using a strategic transport model to appraise the likely impacts and feasibility of land use options associated with the Mid Sussex District Plan (Consultation Draft, October 2011).
- 1.1.2. Mid Sussex District Council (MSDC) sought to understand the travel patterns arising from strategic land use and neighbourhood plan development scenarios. They also aimed to understand the feasibility of delivering these scenarios, in the context of the capacity of the existing transport network and the potential to resolve any access problems by introducing remedial interventions.
- 1.1.3. Amey was commissioned by the District Council (MSDC), in December 2011, to undertake the study, using a derivative of the West Sussex County Transport Model (WSCTM), which is a strategic multi-modal tool developed for West Sussex County Council (WSCC).

### 1.2. The Study Objectives

- 1.2.1. The purpose of the study was to evaluate the transport impacts of District Plan development allocations within Mid Sussex, at forecast years 2021 and 2031. It also considered the requirements of the Highways Agency (HA), West Sussex County Council (WSCC) and East Sussex County Council (ESCC) as the affected highway authorities.
- 1.2.2. Land use impacts were to be examined using the strategic multi-modal WSCTM to represent both highway and public transport (PT) network performance.
- 1.2.3. The main objectives of the Mid Sussex Transport Study (MSTS) were as follows:
  - To revise the WSCTM to give more accurate representation of current transport conditions in key parts of Mid Sussex, especially Burgess Hill;
  - To use the model to predict transport conditions for the AM peak in future years, at 2021, as an interim year for partial completion of planned development and at 2031, as the horizon year for full completion of District Plan development;
  - To take account of land use development in Mid Sussex, with committed improvements to the transport network, under alternative scenarios, namely:
    - a) A 'Baseline', with non-site-specific development, as predicted in the National Trip End Model (NTEM6.2);
    - b) A 'Reference Case', with committed development, only, allocated to specific sites;

- c) A 'Development Case', with committed and strategic development allocated to specific sites and with residual, Neighbourhood Plan development spread across the District, in accordance with the draft Mid Sussex District Plan; and
- To assess the need for and likely success of, remedial transport interventions to mitigate the impact of the 'Development Case' situation.

## 1.3. Report Structure

### 1.3.1. The structure of this Report is as follows:

- Chapter 2 gives a description of the WSCTM and a summary of the model validation;
- Chapter 3 outlines the demand forecasting methodology for the years 2021 and 2031;
- Chapter 4 discusses the development of the future year highway networks;
- Chapter 5 sets out the modelling results and output analysis;
- Chapter 6 provides a summary and conclusions; and
- Chapter 7 considers the reliability of the study findings.

## 2. Model Description and Validation

### 2.1. Context

- 2.1.1. In the context of the MSTS, it was decided to use a strategic transport model, to allow assessment of the wider potential impact of the development locations on the transport network, and the possible solutions in transport terms. It is envisaged that further work will be required, subsequently, to undertake more detailed analysis of impacts on key junctions as may be required by neighbouring highway and planning authorities, including the Highways Agency, East Sussex County Council, Surrey County Council, Lewes District Council, Tandridge District Council, Wealden District Council, Crawley Borough Council, Horsham District Council and the South Downs National Park Authority.
- 2.1.2. To deliver the strategic assessment, the West Sussex County model (WSCTM) at 2008 base year, was used to evaluate the development proposals. WSCTM is a strategic model that encapsulates the road network of West Sussex and surrounding local authorities. At a national level, the model incorporates all strategic zones within Great Britain.
- 2.1.3. Another local model is being assembled, outside this study, to show detailed highway conditions in Burgess Hill. This Burgess Hill Transport Model (BHTM) will give a more precise picture of land use and transport interaction in the town. However, the WSCTM was considered to be the only tool available for this type of strategic transport assessment.
- 2.1.4. The BHTM is an AM peak SATURN highway model derived from the WSCTM, but with extra network and land use detail added into Burgess Hill. It has been assembled by consultants WSP on behalf of Burgess Hill strategic site developers. The BHTM covers only part of the WSCTM area, extending between A272 / B2115, in the north and A27, in the south and between A24, in the west and A275, in the east. It does not include Crawley, Horsham, or East Grinstead and contains only skeleton detail for Haywards Heath.
- 2.1.5. A base year validation of the BHTM has been achieved against 2010 traffic conditions.
- 2.1.6. Further work was undertaken on the WSCTM, to enhance the detailed link and junction data within Mid Sussex zones. This ensured that the multi-modal model would be suitable for the scope of the study. Further details on modelling scope, development and validation are provided in the remainder of this section.
- 2.1.7. The model includes all motorways, primary roads, 'A' roads, 'B' roads and the majority of the 'C' roads that carry significant volumes of traffic, or that are required to provide appropriate representation of access to the villages in the county. Where traffic junctions and traffic signals are likely to have significant effects, the details of their general layout or timing of the signals are also included in the modelling. However, strategic modelling uses aggregate descriptions of traffic such as flow, density and speed, and the relationships between them and hence does not include every road or junction.

- 2.1.8. The WSCTM assesses link capacity and therefore indicates which road sections are likely to experience delays as a result of traffic demand exceeding capacity with a consequent reduction in vehicle speeds. It can also indicate how traffic diverts away from busy routes (i.e. re-distribution effects), where traffic is slowed because of excessive demand, and adds to flows on secondary routes that may be less suitable and hence more sensitive to changes in flows. Overall, the WSCTM is a reasonable tool for the strategic transport assessment of the Mid Sussex District Plan development Strategy.

## 2.2. Model Area

- 2.2.1. The West Sussex County model includes a network that covers the entire county road and public transport infrastructure. The modelled area also has an external area that provides for movements to/from the county to external areas and for through movements. Figure 1 shows the extent of the modelled area in terms of the level of detail in the model.

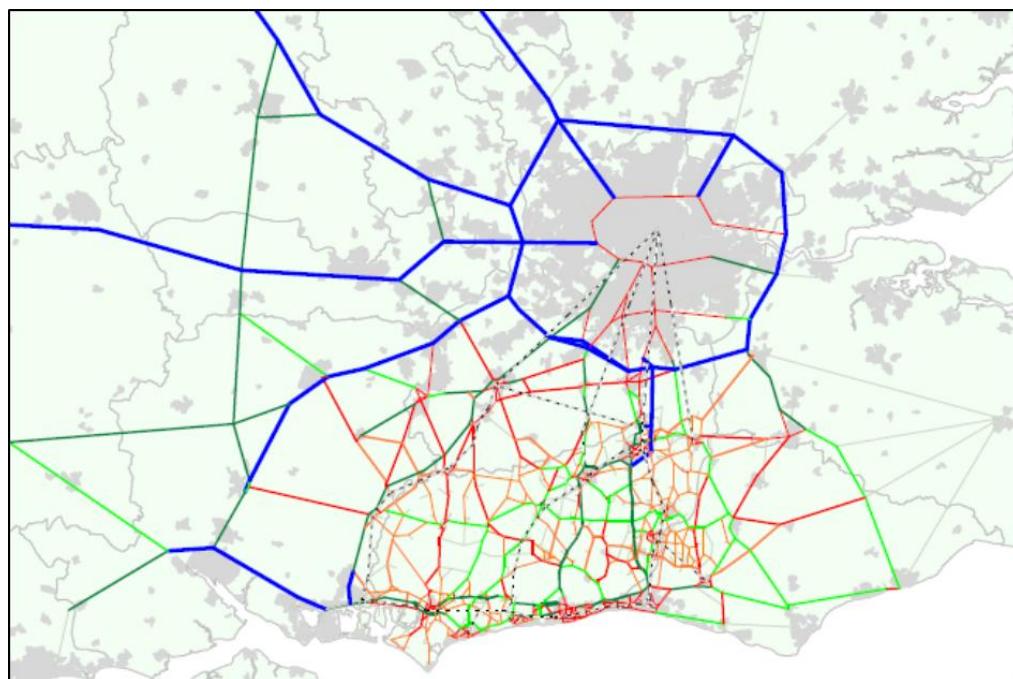

Figure 1: Model Extents

## 2.3. Model History

- 2.3.1. The WSCTM is a strategic traffic assignment model. It was developed using SATURN, to represent highway conditions and Cube, to represent public transport conditions, interlinked by a mode choice model and a trip destination choice model. Originally, the WSCTM was validated to base year AM peak 2008 conditions. It was also configured to represent a forecast situation in 2016 and 2026. These forecast years are not consistent with the development reference dates in the draft Mid Sussex District Plan (i.e. 2021 and 2031).
- 2.3.2. The model's purpose is to show wider-area, inter-urban transport conditions across West Sussex, by road, rail and bus. It is not designed to show detailed travel patterns, or network performance, within local settlements. The highway model is assembled in detailed 'simulation' format in the urban areas and in coarser 'buffer' format, outside.
- 2.3.3. Refinements have been made to the WSCTM highway component for the current study. These refinements comprised the following:
- More accurate replication of trip patterns in Burgess Hill, in line with surveys undertaken in 2010 for the BHTM;
  - More detailed configuration of the local transport network and land use zones in Burgess Hill, to include strategic development sites and accesses; and
  - New network detail covering roads between Burgess Hill and North / South Chailey, to the east, through Ashdown Forest and between Ditchling and Brighton.
- 2.3.4. Amendments have also been made to the WSCTM public transport configuration, as follows:
- Revisions to rail services, to reflect peak time extension of London – Gatwick express trains to and from Brighton; and
  - Updates to local bus services in Burgess Hill.
- 2.3.5. The resulting MSTS strategic base model is a partially updated 2010 version of the 2008 WSCTM. Since analysis of traffic data has indicated little change in traffic volumes and travel patterns in West Sussex over recent years, it is reasonable to take the overall MSTS model as a 2010 base.
- 2.3.6. Forecast outcomes from the MSTS model have then been derived at years 2021 and 2031 instead of 2016 and 2026 in the WSCTM.

## 2.4. Time Periods

- 2.4.1. The WSCTM currently only has the ability to model travel patterns, network performance and intervention impacts during the AM peak period. Reverse tidal travel patterns and consequent network outcomes cannot be identified by the present model.

## 2.5. Journey Purposes

- 2.5.1. All travel demand forecasts in the WSCTM have been derived at a person-trip level for all travel modes combined. The person-trips are split between travel modes within the Cube mode and destination choice model, according to the following trip purposes:
- Home-based work;
  - Home-based education;
  - Home-based other;
  - Employer's business; and
  - Non home-based other.

## 2.6. Model Overview

- 2.6.1. The WSCTM model is implemented in a CUBE environment for the demand models and public transport assignments and interfaces with SATURN as the highway assignment software. In addition, there is a trip end forecasting model that derives the trip ends by purpose, based on user specified planning data and controls. Figure 2 shows the structure of the model and the flow of information between the main elements.

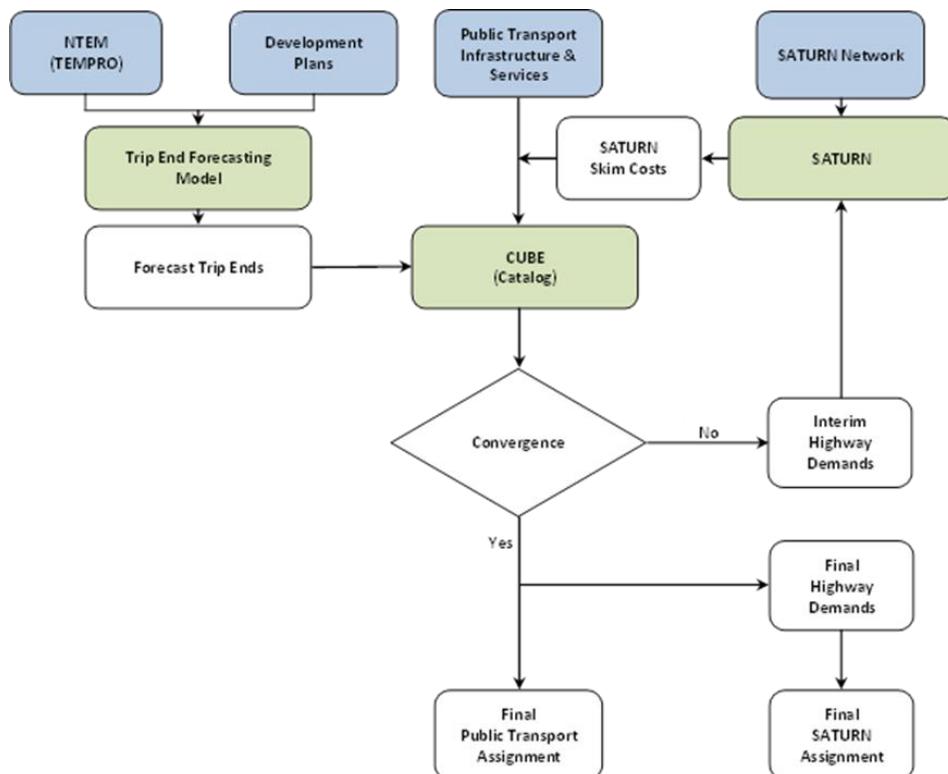

Figure 2: Model Structure

## 2.7. Zoning System

- 2.7.1. The latest inherited version of the West Sussex Strategic Transport Model has a 383-zone system covering the county and the rest of the UK. This was taken as the starting point for a review of the zoning system in the context of the current model update.
- 2.7.2. The WSCTM zoning system has been compared against the proposed zone system for the BHTM, and the proposed locations of the main strategic developments to be tested in the study.
- 2.7.3. The outcome of this review was to make some minor changes to the WSCC zoning system in Burgess Hill. These changes added seven zones to the model with the following aims:
- To enable the strategic developments to be directly allocated to their own zones (zones 387 to 390);
  - To separate out the town centre from the surrounding residential areas, as new zone 386; and
  - To split the single zone bounded by A273 Jane Murray Way into three separate zones, covering the residential area to the north, (zone 165), the industrial area, (zone 385), and the residential area to the south, (zone 384).
- 2.7.4. These small changes to the WSCTM zone system enabled more precise allocation of traffic to the local network and enhanced the validation on the local roads within Burgess Hill.
- 2.7.5. Figure 3 shows the revised zone of Burgess Hill, and Figure 4 shows the zone system in the main area of interest.

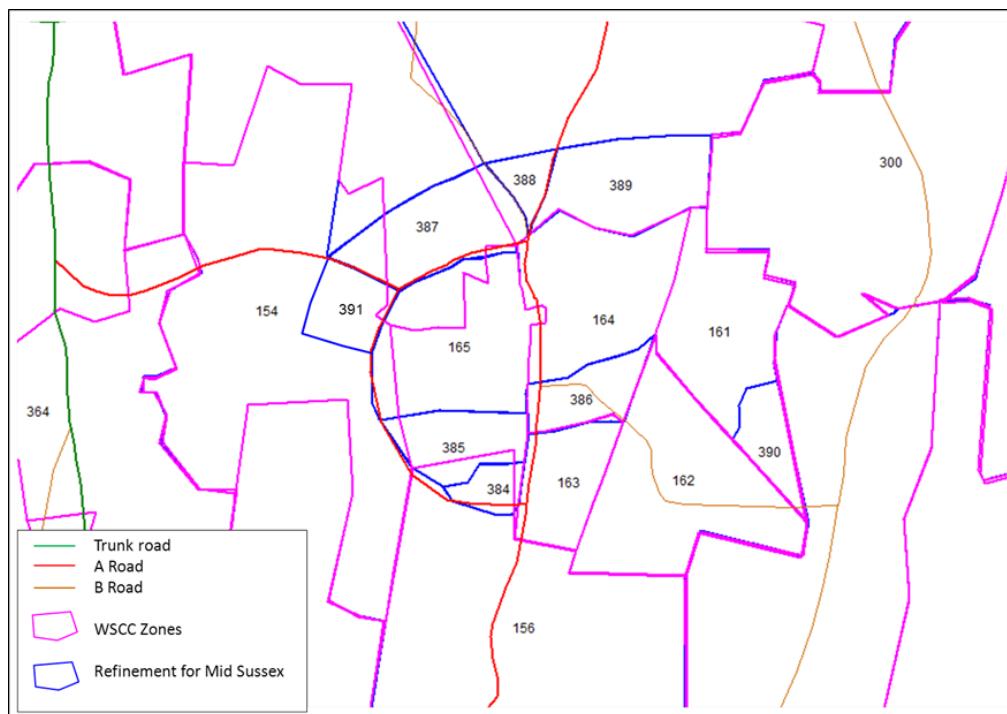

Figure 3: Burgess Hill Zoning

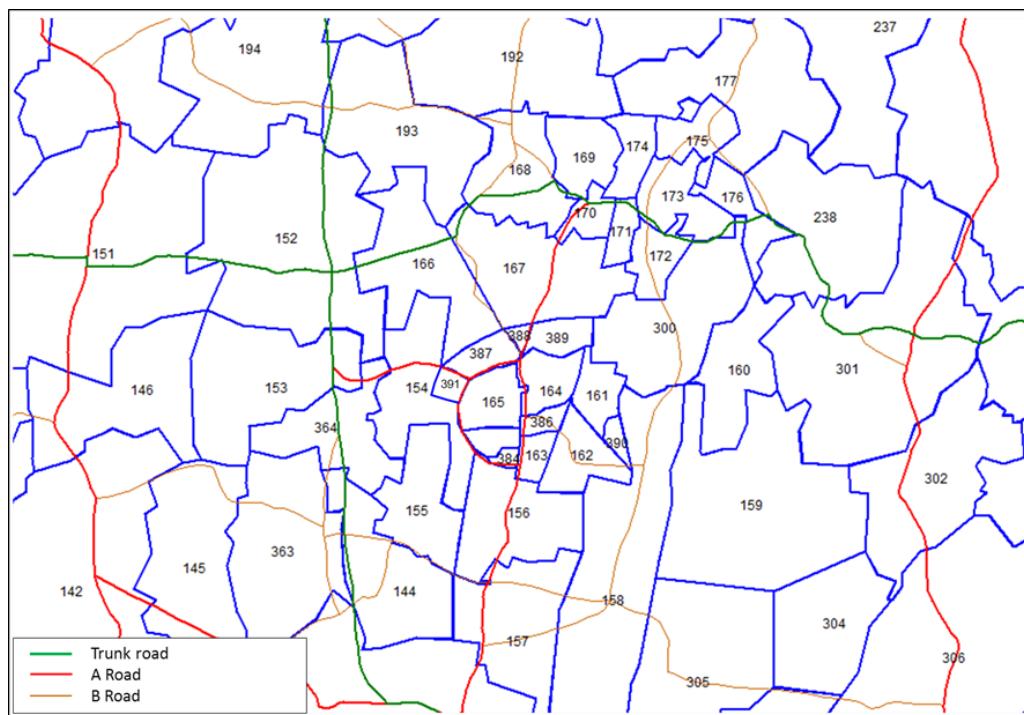

Figure 4: Mid Sussex Zoning

## **2.8. Highway Network Audit and Extension**

- 2.8.1. As the West Sussex County model was originally created for county-wide policy review studies within West Sussex, some areas of the modelled network were not built with the amount of detail required for this particular assessment. Therefore, a network coverage review was completed on the existing modelled highway network in the Mid Sussex area.
  - 2.8.2. Following the network coverage review a number of improvements in network detail were made, namely:
    - Inclusion of roads between Burgess Hill and North / South Chailey, specifically Green Road, North Common Road, South Road, St Helena Lane, Honeypot Lane and Mill Lane;
    - To the east, through Ashdown Forest, specifically Legsheath Lane, Colemans Hatch Road, Kidds Hill, B2026 and B2188; and
    - Between Ditchling and Brighton, specifically Ditchling Road.

## **2.9. Public Transport Alterations**

- 2.9.1. Amendments have also been made to the WSCTM public transport configuration, as follows:

  - Revisions to rail services, to reflect peak time extension of London – Gatwick express trains to and from Brighton; and
  - Updates to local bus services in Burgess Hill.

## 2.10. Traffic Data

- 2.10.1. Comprehensive traffic data were collected in and around Burgess Hill for the construction of the BHTM, in addition to existing data already available. The following data was supplied for updating the WSCTM:
- Road Side Interviews (RSI);
  - Automatic Traffic Counts (ATC);
  - Manual Classified Turning Count (MCC); and
  - Journey Time surveys.
- 2.10.2. To complement the data collected for the BHTM, additional traffic information has been made available by West Sussex County Council (WSCC), East Sussex County Council (ESCC) and London Area Transport Study (LATS). More detailed information on the data collection exercise can be found in the BHTM Data Collection Report (February 2011).

### Roadside Interviews (RSI)

- 2.10.2.1 In November 2010, data were collected from 5 RSI sites around Burgess Hill, West Sussex. Information was collected between the hours 0700-1000. The locations of the survey sites are given in Table 1 below and also shown graphically in Figure 5.

| <b>Table 1: Roadside Interview Locations</b> |                                   |                      |                  |
|--|-----------------------------------|----------------------|------------------|
| <b>Site No.</b>                              | <b>Name</b>                       | <b>Date</b>          | <b>Direction</b> |
| 1  | A2300 Approach to Jane Murray Way | 11/11/10 (Thursday)  | Eastbound        |
| 2  | B2030 at Pains Flat               | 11/11/10 (Thursday)  | Southbound       |
| 3  | A273 Isaac's Lane                 | 11/11/10 (Thursday)  | Southbound       |
| 4  | Valebridge Rd                     | 10/11/10 (Wednesday) | Southbound       |
| 5  | B2113 Folders Lane                | 10/11/10 (Wednesday) | Westbound        |

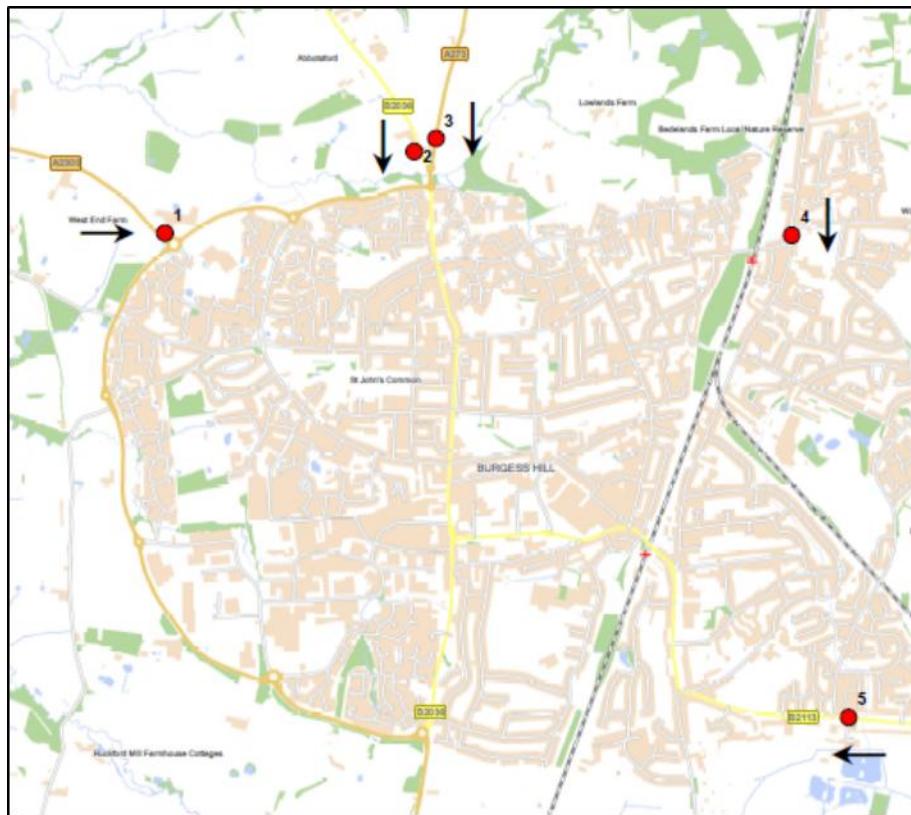

Figure 5: Roadside Interview Locations

2.10.2.2 The RSI's were used to construct highway trip matrices at these locations before omitting these identified trips from the existing base matrices. This enabled a number of trips travelling in and out of Burgess Hill to be replaced with those from the observed RSI data. In this way, the subsequent matrices inherited the observed RSI trip distribution.

#### Automatic Traffic Counts (ATC)

2.10.2.3 Four separate sources of ATC data were identified as follows:

- BHTM temporary ATC Sites;
- Existing WSCC ATC traffic monitoring sites;
- Ad-hoc WSCC ATC sites; and
- Existing East Sussex County Council (ESCC) ATC traffic monitoring sites.

2.10.2.4 The locations of the survey sites are shown graphically in Figure 6.

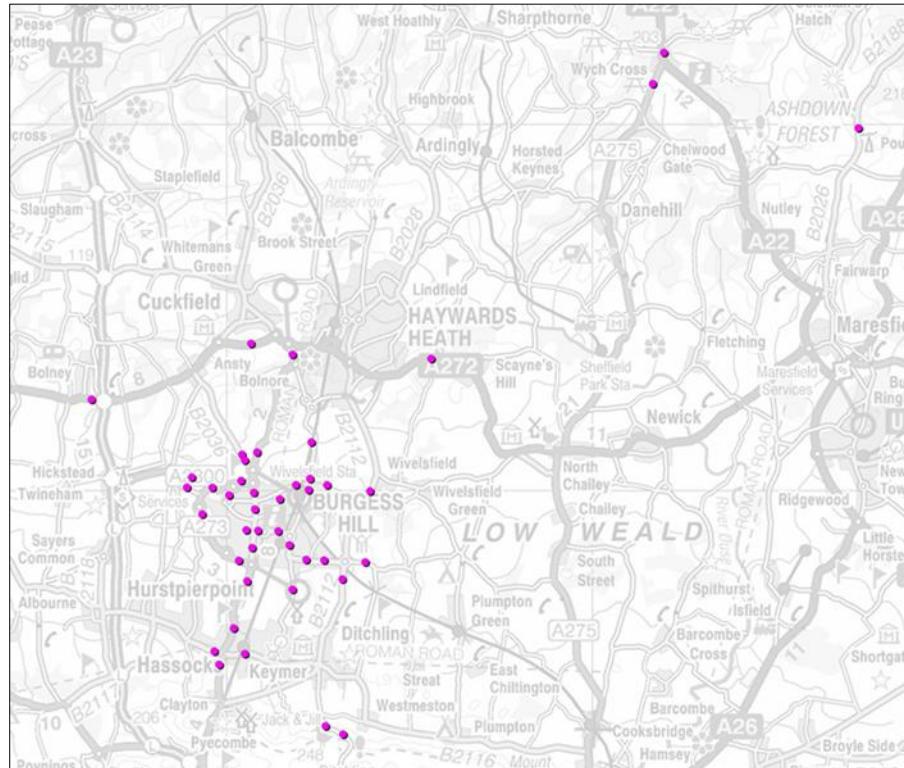

Figure 6: ATC Locations

#### Manual Classified Counts (MCC)

2.10.2.5 Turning count data were supplied for 20 sites collected for the BHTM and by ESCC. The location of the counts is provided in Figure 7. Table 2 provides further information on the location of the surveys.

**Table 2: Manual Classified Count Locations**

| Site No. | Junction  | Date         |
|----------|---|--------------|
| 1        | Hammonds Ridge/A273 Jane Murray Way                   | 3rd Nov 2010 |

### Journey Time Surveys (JTS)

2.10.2.6 Journey time data were supplied for four routes collected for the BHTM. Key routes in the Burgess Hill area were surveyed using the 'moving observer' method between 4th and 18th November 2010 for the AM period (0700 – 1000). Figure 8 shows the location of the journey time routes.

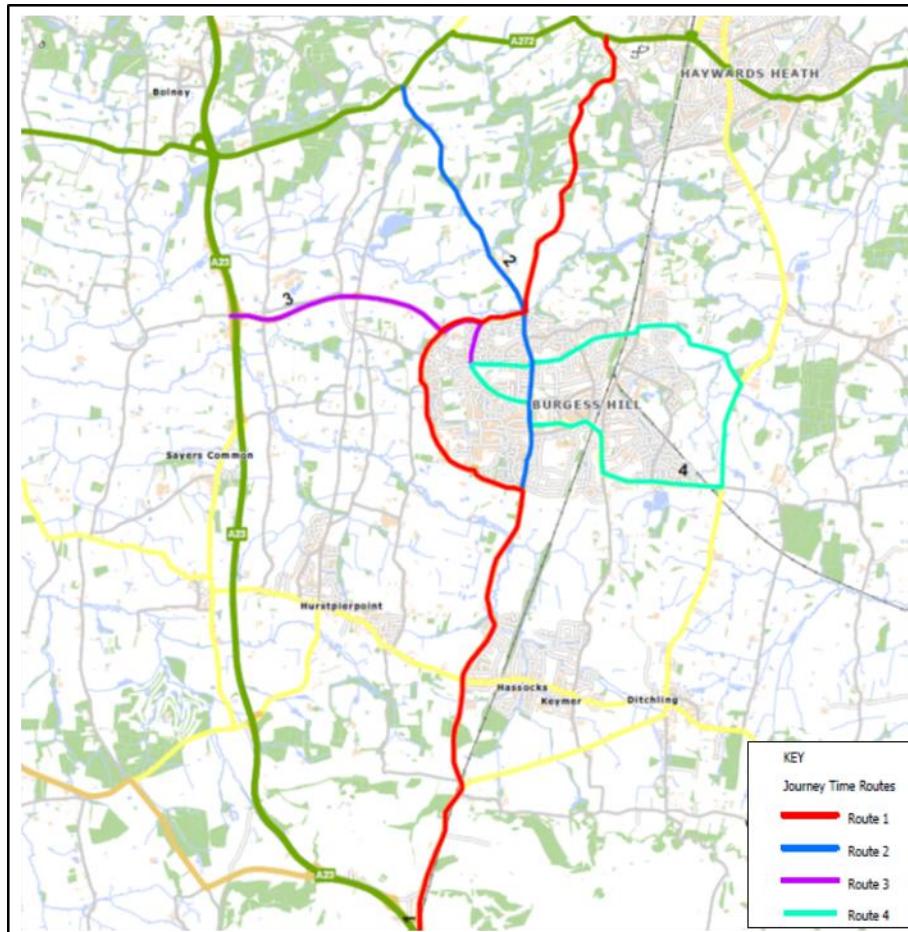

Figure 8: Journey Time Survey Routes

## 2.11. Model Validation

2.11.1. The WSCTM has previously undergone an extensive calibration and validation process, the results of which were reported in detail in February 2011. The main validation statistics for the entire model as previously reported are shown in Table 3.

2.11.2. The five major model validation tests are summarised below:

- 1) For movements between 700 vph and 2700 vph, the proportion of flows modelled within 15% of observed should be greater than 85%; and
- 2) For movements less than 700 vph the proportion of flows modelled within 100 vph of observed should be greater than 85%;

- 3) For movements greater than 2700 vph, the proportion of flows modelled within 400 vph of observed should be greater than 85%;
- 4) The total percentage of assigned flows in each model that have a 'GEH' value of less than 5.0, when compared to observed counts, should be 85%; and
- 5) The percentage of all journey time routes, which have a modelled times within 15% of observed times (or 1 minute, if higher), should be greater than 85%.
- 2.11.3. Table 3 shows that the WSCTM model fully satisfies DMRB requirements to a level that would be expected for major funding allocations or scheme bids.

| <b>Table 3: Overall Model Validation Statistics</b>    |                    |
|--|--------------------|
| <b>Criteria and Measure</b>                            | <b>Performance</b> |
| 1. Individual flows within 15% (flows 700 – 2,700 vph) | 88.6%              |
| 2. Individual flows within 100 vph (flows <700vph)     | 87.2%              |
| 3. Individual flows within 400 vph (flows >2,700vph)   | 100.0%             |
| 4. GEH statistic: Individual flows: GEH < 5            | 89.1%              |
| 5. Highway Journey Time Validation                     | 92.3%              |

## 2.12. Updated Model Validation

- 2.12.1. As previously outlined, in order to ensure robust assessments, a number of updates to the WSCTM model have been made, namely:
- More accurate replication of trip patterns in Burgess Hill, in line with surveys undertaken in 2010 for the BHTM;
  - More detailed configuration of the local transport network and land use zones in Burgess Hill, to include strategic development sites and accesses; and
  - New network detail covering roads between Burgess Hill and North / South Chailey, to the east, through Ashdown Forest and between Ditchling and Brighton;
  - Revisions to rail services, to reflect peak time extension of London – Gatwick express trains to and from Brighton; and
  - Updates to local bus services in Burgess Hill.
- 2.12.2. After refining the WSCTM, an acceptable validation has been achieved. Performance of the 2010 highway model is good compared with DMRB accuracy thresholds for each-way assigned and observed flows across a Burgess Hill cordon and across N/S and E/W screen-lines within the town. The 'GEH' is an error statistic that represents the closeness between modelled and observed criteria. Overall, the proportion of link flows with 'GEH' of less than 5 is 86% (target: 85% of link flows with GEH of less than 5).

- 2.12.3. Model performance is less good compared with thresholds for journey time accuracy. It achieves acceptable accuracy on 75% of routes (six out of eight) where modelled journey times are within 15% of observed (target: 85% of routes with journey times within 15% of observed). The inaccuracy arises from the necessary omission of some network and zoning detail in Burgess Hill, which means that the strategic model cannot truly replicate all local junction congestion and delay.
- 2.12.4. We have also checked the wider validation of the strategic MSTS highway model, to ensure that changes made in Burgess Hill have not adversely affected the accuracy of the model elsewhere. The results are shown in Table 4. In terms of assigned traffic flows, overall, 86% of surveyed routes have a 'GEH' of less than 5 (target: 85%), indicating that the wider 2010 strategic model is still reliable. In terms of route journey times, including the A272 and A23, the model represents 85% of routes as having journey times within 15% of observed, which also indicates that the strategic MSTS highway model is valid.

**Table 4: Overall Model Validation Statistics**

| Criteria and Measure                                   | Performance |
|--|-------------|
| 1. Individual flows within 15% (flows 700 – 2,700 vph) | 86.4%       |
| 2. Individual flows within 100 vph (flows <700vph)     | 88.4%       |
| 3. Individual flows within 400 vph (flows >2,700vph)   | 87.5%       |
| 4. GEH statistic: Individual flows: GEH < 5            | 85.5%       |
| 5. Highway Journey Time Validation                     | 85.0%       |

## 3. Demand Forecasting

### 3.1. Overview

- 3.1.1. There are three, AM peak, travel demand scenarios represented in the MSTS at each of forecast years 2021 and 2031, namely, Baseline, Reference Case and Development Case. Main components of these scenarios are outlined below.
- 3.1.2. Development outside Mid Sussex is handled consistently in each of the three scenarios. Here, future demand is based upon planning data (households and jobs) and trip forecasts contained in NTEM6.2. The only exceptions are Crawley Main and Horsham Rural zones, where the largest strategic, committed, residential and employment developments have been modelled in all scenarios as site-specific trip movements, using land use assumptions from relevant transport assessments and TRICS trip rates.
- 3.1.3. Detailed trip patterns have not been modelled for proposed development sites in Lewes district (East Sussex), because these sites are not commitments and do not have sufficient certainty of progressing. Developments further afield in Horsham district (Broadbridge Heath) have not been represented specifically, since they lie outside the core areas of interest in the MSTS model.

### 3.2. Development Scenarios

- 3.2.1. This transport assessment focuses on three different demand scenarios, namely:
  - Baseline – The Baseline forecast represents NTEM6.2 trip growth for Mid Sussex, from base year, without any adjustment to planning data (households and jobs) and without any site-specific development trips in any model zones;
  - Reference Case – The Reference Case represents committed developments only, modelled on a site specific basis, with no other NTEM growth in Mid Sussex; and
  - Development Case – The Development Case represents committed and strategic land uses, modelled on a site specific basis, with inclusion of further NTEM growth in Mid Sussex to represent Neighbourhood Plan development.
- 3.2.2. A breakdown of the individual components of planning data for each development scenario, in terms of households and jobs, is shown in Table 5 with site specific locations shown in Figure 9.

**Table 5: Development Scenarios**

| Location/Description                   | Dwellings |      | Jobs |      | Baseline | Reference Case | Development Case |
|--|-----------|------|------|------|----------|----------------|------------------|
|  | 2021      | 2031 | 2021 | 2031 |          |                |                  |
| <b>Committed Developments</b>          |           |      |      |      |          |                |                  |

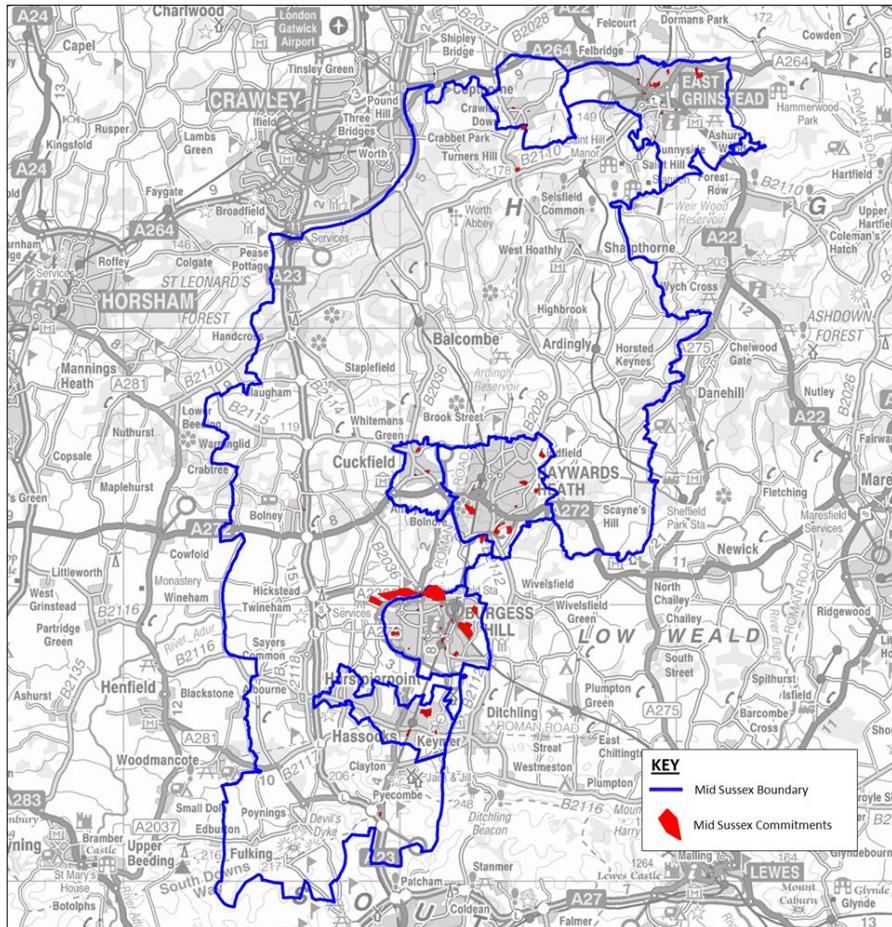

Figure 9: Development Site Locations

- 3.2.3. In order to exclude A2300 Business Park from NTEM, for the Baseline and Reference Case, the size of the strategic employment site has been measured in terms of its number of jobs, shown in Table 5. However, for modelling site-specific arrivals and departures in the Development Case, the A2300 Business Park has been assessed by applying TRICS multi-modal trip rates per 100sqm GFA to the site's gross external area (GEA). The development area of 20 hectares has been converted into equivalent jobs and trip rates, on the basis of evidence from MSDC, as shown in Table 6.

**Table 6: Calculation of Jobs and Trips at A2300 Business Park (2031)**

| 60% of 20ha site will be developed, i.e. 12ha |                 |          |                    |                   |          |   |   |                                    |                                      |
|---|-----------------|----------|--------------------|-------------------|----------|---|---|------------------------------------|--------------------------------------|
| Land-Use Type                                 | % of Total Area | GEA (ha) | Ratio of NIA / GEA | NIA (sqm) per Job | No. Jobs | Trip Arrivals per 100sqm GFA (GEA) (Persons, all modes) | Trip Departures per 100sqm GFA (GEA) (Persons, all modes) | Total AM Peak Person Trip Arrivals | Total AM Peak Person Trip Departures |

| B2 Industry                                   | 13%             | 1.84     | 85%                | 36.0              | 364      | 0.600   | 0.253   | 110                                | 47                                   |
| B8 Distribution                               | 15%             | 1.80     | 95%                | 70.0              | 244      | 0.038   | 0.019   | 7                                  | 3                                    |
| Overall                                       | 100%            | 12.00    |                    |                   | 4,842    |   |   | 1,330                              | 220                                  |

- 3.2.4. The total AM peak trip arrivals and departures at the site are adjusted slightly in the model, as shown in Table 15, to equalise the matrix origin and destination totals.

### 3.3. Strategic Development Allocations at 2031

- 3.3.1. The MSTS appraisal has been based upon the following schedule of strategic development in Burgess Hill, by 2031, as specified by MSDC for the draft District Plan:
- Land to the north and north west of Burgess Hill – 3,500 dwellings;
  - Land to the east of Burgess Hill, at Kingsway – 500 dwellings; and
  - A2300 Business Park – 20ha / 4,845 jobs.

### 3.4. Mid Sussex Travel Demand Components

- 3.4.1. The Baseline demand scenario represents the likely outturn pattern of travel movements, in Mid Sussex, if growth follows national trends, as predicted in NTEM6.2, rather than local trends.
- 3.4.2. In the Baseline, NTEM6.2 trip forecasts have been used for all Mid Sussex zones (Burgess Hill, Haywards Heath, East Grinstead, Cuckfield, Copthorne, Crawley Down, Hurstpierpoint / Keymer and Rural).

- 3.4.3. It was judged that the Baseline NTEM planning forecasts (2011-2031) are roughly equivalent to MSDC forecasts of committed housing development (existing planning permissions and housing allocations) plus the proposed strategic housing allocations at Burgess Hill (about 8,400 households, in total), but that they exclude proposed Neighbourhood Plan allocations (about 2,300 households).
- 3.4.4. It was also calculated that the Baseline NTEM forecasts are roughly equivalent to MSDC forecasts of committed employment development (existing planning permissions and employment allocations) plus half of the proposed strategic employment allocations at Burgess Hill (about 5,000 jobs, in total), but that they exclude the remaining half of the proposed strategic and all of the Neighbourhood Plan allocations (about 5,100 jobs).
- 3.4.5. The Baseline is not especially helpful for comparison with detailed development outcomes, as it includes partial planning data for Mid Sussex strategic sites and no data for neighbourhood sites. It therefore reflects neither a situation with full development, re-apportioned between districts, nor a situation without any local development.
- 3.4.6. For the future year Reference and Development Case assessments (2021 and 2031), NTEM6.2 trip forecasts were used as the county-wide and regional basis of traffic growth estimation. However, within Mid Sussex there was likelihood that demand would be exaggerated, if site-specific trip patterns were added on top of NTEM, because NTEM considers committed and strategic development within its estimation of traffic growth.
- 3.4.7. If Mid Sussex development traffic was to be assigned to links on the network with standard NTEM growth already applied, it would mean that committed and strategic development traffic would have been incorporated twice. Therefore, owing to these concerns over the possibility of double counting growth of development traffic, the following procedure for deriving background growth has been undertaken.
- 3.4.8. In the Reference Case, all NTEM trip growth in Mid Sussex has been excluded and replaced by site-specific trips for committed developments, only, calculated using TRICS. The NTEM background growth that is part of the Baseline has been excluded, as it represents strategic development that should not be included in the Reference Case.
- 3.4.9. The Reference Case represents a more useful benchmark for comparing with detailed development outcomes, as it excludes all strategic and neighbourhood plan development and, therefore, gives a truer picture of likely development impacts.
- 3.4.10. In the Development Case, all NTEM trip growth in Mid Sussex has again been removed but, this time, replaced by site-specific trips for committed and strategic developments. In addition, proposed Neighbourhood Plan development has been incorporated as extra households and jobs in NTEM, spread amongst Mid Sussex neighbourhoods in line with NTEM growth proportions and adjusted according to MSDC advice.

### 3.5. Development Phasing

- 3.5.1. Likely phasing of land use developments, in future years, was agreed to be as follows:

- Committed development (Reference Case and Development Case) – 100% by 2021 and also by 2031;
- Strategic development (Development Case only) – 50% by 2021 and 100% by 2031; and
- Neighbourhood Plan development (Development Case only) – 50% by 2021 and 100% by 2031.

### **3.6. NTEM**

3.6.1. Table 7, below, shows the adjusted NTEM planning data, under the Development Case and Reference Case, compared with the Baseline NTEM forecast. It indicates the planned household and job growth, between 2011 and 2031, for NTEM only and for committed sites, strategic sites and Neighbourhood Plan sites, respectively.

**Table 7: Comparison of Baseline NTEM Planning Data with Reference and Development Cases**

| NTEM 6.2       |  |                       |      | Commitments                |             |       | Strategic Sites            |             | Non-Strategic Sites                     |             |      |
|----------------|--|-----------------------|------|----------------------------|-------------|-------|----------------------------|-------------|---|-------------|------|

3.6.2. Tables 8 to 12 show the NTEM growth factors derived for the Mid Sussex Study Areas. Growth factors have been derived at a person-trip level for all travel modes combined according to the following trip purposes:

- Home-based work (Table 8);
- Home-based education (Table 9);
- Home-based other (Table 10);
- Employer's business (Table 11); and
- Non home-based other (Table 12).

| Cuckfield             | 1.10      | 1.09 | 1.15      | 1.14 | 1.00           | 1.00 | 1.03      | 1.03 | 1.04             | 1.04 | 1.12      | 1.11 |

- 3.6.3. Tables 8-12 represent NTEM background growth before site-specific development trips are added into the model. Some of the NTEM factors in the Reference and Development Cases are less than 1.0, because a combination of committed, strategic and Neighbourhood Plan household and job data have been subtracted, before being added back as development trips. However, the modelled matrix trip end growth rate is always greater than 1.0.

### **3.7. Heavy Goods Vehicle Forecasts**

- 3.7.1. The growth in heavy goods vehicles (HGV) was assumed to follow national average trends and was therefore derived from the DfT's National Transport Model (NTM) Road Transport Forecasts (RTF09). The growth rates are shown in Table 13.

**Table 13: Heavy Goods Vehicle Growth Factors**

| Modelled Years | HGV Growth Factor |
|----------------|-------------------|
| 2008-2021      | 1.114             |
| 2008-2031      | 1.178             |

### **3.8. Trip Rate Estimates for Individual Sites**

- 3.8.1. Details of committed and strategic residential and employment sites in Mid Sussex were provided by MSDC. Multi-modal person trip rates from the TRICS database have been applied to the specified land use characteristics to derive site-specific trip arrivals and departures during the AM peak hour (0800 – 0900), for inclusion in zones in the MSTS model.
- 3.8.2. Multi-modal person trip rates have been applied to the committed and strategic developments, using a range of typical sites from TRICS, as agreed with the West Sussex County Council (WSCC) Highway Authority and MSDC.
- 3.8.3. Since it is a multi-modal model, the MSTS applies multi-modal person trip rates to the Burgess Hill strategic residential and employment land uses, whereas the BHTM uses highway-only trip rates. Consequently, the trip arrivals and departures at Northern Arc, East of Kingsway and A2300 Business Park, shown in Table 15, are different in MSTS from those calculated for BHTM. This difference is increased further by the mechanics of the MSTS forecast variable demand mode, because, as noted in section 5.4, the variable demand model has to equalise matrix origin and destination totals for assignment purposes. It also has to allow for changes in destination choice.
- 3.8.4. This methodology was used for all sites except for two major development sites near Crawley. For the Crawley committed developments (i.e. Kilnwood Vale and North East Sector), trip rates have been taken from the respective development transport assessment documents. A summary of trip rates for each development component of the model is given below in Table 14.

**Table 14: Person Trip Rates**

| Land Use Type  | Unit          | Arrivals | Departures |
|--|---------------|----------|------------|
| <b>Mid Sussex Developments (Committed and Strategic)</b> |               |          |            |
| Residential  | per dwelling  | 0.121    | 0.681      |
| A1: Retailing  | per 100m2     | 5.285    | 3.564      |
| A2: Financial/Professional Services                      | per 100m2     | 1.789    | 0.074      |
| B1a: Offices   | per 100m2     | 1.789    | 0.074      |
| B1b: Research/Development                                | per 100m2     | 2.235    | 0.305      |
| B1c: Light Industry                                      | per 100m2     | 0.601    | 0.235      |
| B2: General Industry                                     | per 100m2     | 0.600    | 0.253      |
| B8: Storage & Distribution                               | per 100m2     | 0.038    | 0.019      |
| C1: Hotel  | per 100m2     | 0.455    | 0.816      |
| D2: Leisure  | per 100m2     | 0.868    | 1.06       |
| <b>Crawley Kilnwood Vale</b>                             |               |          |            |
| Residential  | per dwelling  | 0.359    | 0.757      |
| Employment   | per 100m2     | 1.88     | 0.390      |
| Foodstore  | per 100m2 RFA | 8.12     | 4.811      |
| <b>Crawley North East Sector</b>                         |               |          |            |
| Residential - Private Houses                             | per dwelling  | 0.240    | 0.759      |
| Residential - Non Private Houses                         | per dwelling  | 0.206    | 0.665      |
| Residential - Private Flats                              | per dwelling  | 0.114    | 0.451      |
| Residential - Non Private Flats                          | per dwelling  | 0.185    | 0.445      |
| B1   | per 100m2     | 1.789    | 0.074      |
| B2   | per 100m2     | 0.600    | 0.253      |
| B8   | per 100m2     | 0.038    | 0.019      |

### 3.9. Additional Person Trips

- 3.9.1. Table 15 shows the estimated number of additional person trip arrivals and departures generated from the committed and strategic developments during the AM peak hour (0800 – 0900).

- 3.9.2. The negative values that appear in Tables 15 relate to an overall reduction in trips for particular areas caused by a change in land use i.e. a switch from commercial to residential or residential to commercial or a large change in the (GFA) or number of dwellings. Such changes can have an impact on the amount of trips produced from a development and more specifically change the balance in the amount of departures and arrivals.

**Table 15: Additional Person Trips**

| Location/Description                      | 2021     |            | 2031     |            |
|---|----------|------------|----------|------------|
|   | Arrivals | Departures | Arrivals | Departures |
| <b>Committed Residential Developments</b> |          |            |          |            |

### 3.11. Demand Modelling

- 3.11.1. As outlined in Chapter 2, the Mid Sussex Study uses the latest version of the updated West Sussex County Model (WSCTM). The model is AM peak hour only, but includes trip generation, distribution and mode choice models, which provide an element of variable demand modelling.

#### Trip End Model

- 3.11.1.1 The trip end model derives future year demands based on changes in socio-economic data (car ownership/availability), demographic data (population and employment trends), and development plans. The output from the trip end model, which is based on NTEM and local planning projections, is a set of growth factors by purpose at a zone level for use in a Fratar growth factoring process, which updates the demand matrices to a set of balanced trip ends. New development areas, where the base year demands are low, are derived using the calibrated distribution functions.
- 3.11.1.2 The trip end model is not cost-dependent and the future year trips produced are based entirely on growth in car ownership, population and other demographic factors. The model assumes that the propensity to travel, or trip frequency, remains as observed in the base case for car and non-car-available travellers.

#### Trip Distribution

- 3.11.1.3 The distribution functions are calibrated to the observed trip length distribution, in relation to the generalised time of travel. The functions are based on the observed data from the roadside interviews, ensuring that the functions are pertinent to the strategic movements of primary interest.
- 3.11.1.4 The distribution functions are applied to produce synthetic flows in a reference and test scenario and to then determine the incremental change in demand, for application to the observed reference case flows. This enables the model to take account of any effect of increases in generalised time on the average distance travelled. The functions are applied in a doubly-constrained mode and to the AM peak hour matrices by purpose.

#### Mode Choice

- 3.11.1.5 The mode choice models have been set up and calibrated by purpose for the AM peak hour. The calibration process involved the importation of initial spread parameters, or lambda values, based on WebTAG Guidance and then the incremental adjustment of the spread parameters and modal constants for each purpose, until the modelled market shares matched the observed shares based on the developed car, bus and rail matrices.

- 3.11.2. The above demand models are applied in an iterative process. The outturn demands derived from the first iteration are used to create new generalised times for input to the second iteration of the demand models. This process is repeated until an acceptable level of convergence between demand and supply costs is achieved. This is normally achieved within five iterations, so the default within the model is to run five iterations.

## 4. Future Year Network Development

### 4.1. Overview

- 4.1.1. Adjustments have been made to the MSTS base strategic model to reflect four strategies for future, cumulative, transport intervention, namely:
- Committed schemes, which will be implemented in all future scenarios (Baseline, Reference Case and Development Case (1, 2 and 3));
  - Primary remedial schemes, to mitigate land use impacts, included in the Development Case (2 and 3); and
  - Secondary remedial schemes, included in the Development Case (3).
- 4.1.2. Committed schemes include all interventions that are located inside and outside Mid Sussex District. Remedial schemes are in Mid Sussex, only.

### 4.2. Committed Interventions

- 4.2.1. Table 17 itemises the committed interventions, within Mid Sussex, represented in all model assignments. Other committed schemes have been represented outside Mid Sussex, but for brevity they are not listed here. These other schemes have been carried forward from the WSCTM Forecasting Report (Amey / WSCC, 22nd July 2011) and are listed in Table 3.1 of that document.

| Table 17: MSTS Committed Transport Interventions |  |                     |   |
|--|--|---------------------|---|
| General Location                                 | Description  | Type of Scheme      | MSTS Modelling Assumptions  |
| Haywards Heath                                   | Completion of the Haywards Heath Relief Road Stages 5 & 6 (Stages 1 – 4 already implemented) | Highway Improvement | New highway links and junctions, with capacity and speed improvements, where appropriate  |
| A23  | A23 Handcross - Warninglid (HA scheme)   | Highway Improvement | Link speed and capacity improvements, comprising: A23 widening from dual 2-lane to 3-lane all-purpose carriageway; closure of direct A23 accesses; local access road along west side of A23; dual 2-lane slips, dual 2-lane over-bridges and dumbbell roundabouts at both terminal junctions. |

### 4.3. Primary Remedial Interventions

4.3.1. Table 18 shows the Primary Remedial interventions that have been modelled in development Cases (2 and 3). These interventions were identified by WSCC, in December 2011, as being potentially necessary to facilitate strategic development in Burgess Hill. They follow from the Report of the Focus Group – Burgess Hill Town Wide Strategy (i-transport / WSP, February 2011). The schemes have been consolidated by Amey for the MSTS, into a format compatible with the strategic model.

**Table 18: MSTS Primary Remedial Transport Interventions**

| General Location | Description  | Type of Scheme                                   | MSTS Modelling Assumptions  |
|------------------|--|--|---|
| Burgess Hill     | Northern Arc Link Road between A2300 & A273  | Highway Access for Development                   | Single 2-lane all-purpose carriageway (40mph), with access roundabouts, between A2300, B2036, A273 and Maple Drive  |
| Burgess Hill     | Parking Strategy scheme<br>- Introduction of a CPZ for the centre of Burgess Hill<br>- potential extensions (e.g. Wivelsfield Station)   | Car Parking Regulations                          | Highway parking charge increase, applied to all land uses and trip purposes within Burgess Hill town centre zones only; the charge increase is £6, i.e. doubling of the typical, all-day charge.  |
| Burgess Hill     | Bus service frequency and route connectivity enhancements, combined with sustainable transport links, improved passenger / parking facilities at bus / rail interchanges and links to development sites, including construction of Charles Avenue - Victoria Road bus-only link. | Bus Route Connectivity – New routes and services | New local bus services connecting:<br>Kingsway development - B2113 - Burgess Hill Stn - Mill Rd - Leylands Rd - B2036 - N Arc - Wivelsfield Stn - Junction Rd - Cants La (2-way; 20-min headway).<br>A2300 Business Park and Northern Arc development - Wivelsfield Stn - Junction Rd - Burgess Hill Stn - B2113 - Victoria Rd - Charles Av - A273 JMW (2-way; 20-min headway). |
| Burgess Hill     | Victoria Road – York Road highway link   | Omitted from model                               | Scheme excluded, because model is too coarse to show meaningful, new alignment  |

**Table 18: MSTS Primary Remedial Transport Interventions**

| <b>General Location</b>        | <b>Description</b>   | <b>Type of Scheme</b>   | <b>MSTS Modelling Assumptions</b>   |
|--------------------------------|--|---|---|
| Burgess Hill                   | Traffic management strategy on the B2036, between Burgess Hill and Ansty, to mitigate the impact of future developments in Burgess Hill and Haywards Heath | Highway Traffic Restraint, such as carriageway build-outs, narrowing, alternate priority working and reduced speed limit, giving 15% speed reduction and 25% capacity reduction | 40mph speed limit and capacity constraint over entire length of B2036 between A272 Ansty and A273 Fairplace Bridge  |
| Burgess Hill ./ Haywards Heath | Safety-led improvements to A273 Isaac's Lane, between Burgess Hill and Bolnore   | Highway Traffic Restraint, giving 15% speed reduction   | 40mph speed limit over entire length of route between B2036 Fairplace Bridge and A272 Bolnore   |
| Burgess Hill                   | Downgrading the A273 Jane Murray Way / Sussex Way, between A2300 and A273 Fairplace Bridge   | Highway Traffic Restraint   | 20mph speed limit and capacity constraint on A273 between A2300 and B2036 Fairplace Bridge  |
| Burgess Hill                   | Route Strategy Improvement - A2300 A23 Hickstead junction to Burgess Hill. Localised carriageway widening at junctions A23 – A273                          | Highway Improvement   | Widen junction approaches on A2300 to 3 lanes at A23, Hickstead, Cuckfield Rd and A273 Jane Murray Way  |
| Hickstead                      | Junction improvements - A23 trunk road with the A2300 (Highways Agency scheme)   | Highway Junction Improvement – localised widening   | Junction capacity improvement with 3-lane dumbbell junction approaches from all arms, dual 2-lane over-bridge and dedicated left turn lanes at both roundabouts, with single lane slips |
| Burgess Hill                   | Junction improvement - A273 Fairplace Bridge double mini-roundabout junction   | Highway Junction Improvement – widening on approaches   | Linked traffic signals with localised widening to give increased approach capacity on all arms from single to two lanes   |
| Burgess Hill                   | London Road / Leylands Road and London Road / West Street junctions - potential signal control   | Highway Junction Improvement  | Linked traffic signals with localised widening to give increased approach capacity on all arms from single to two lanes   |

**Table 18: MSTS Primary Remedial Transport Interventions**

| <b>General Location</b> | <b>Description</b>   | <b>Type of Scheme</b>        | <b>MSTS Modelling Assumptions</b>  |
|-------------------------|--|------------------------------|--|
| Burgess Hill            | London Road / Royal George Road / Lower Church Road - signal upgrade   | Highway Junction Improvement | Improved traffic signals with localised widening to give increased approach capacity on all arms from single to two lanes  |
| Burgess Hill            | Junction Road / Leylands Road / Valebridge Road / Janes Lane junctions – potential signal control  | Highway Junction Improvement | Linked traffic signals with localised widening to give increased approach capacity on all arms from single to two lanes  |
| Burgess Hill            | B2113 / B2112 junction – potential signal control  | Highway Junction Improvement | Traffic signals with localised widening to give increased approach capacity on all arms from single to three lanes   |
| Burgess Hill            | Folders Lane / Kings Way junction – potential signal control   | Highway Junction Improvement | Traffic signals with localised widening to give increased approach capacity on all arms from single to two lanes   |
| Burgess Hill            | Folders Lane / Keymer Road junction – potential signal control   | Highway Junction Improvement | Traffic signals with localised widening to give increased approach capacity on all arms from single to two lanes   |
| Burgess Hill            | Junction Road / Cants Lane junction – potential signal control   | Highway Junction Improvement | Traffic signals with localised widening to give increased approach capacity on all arms from single to two lanes   |
| Burgess Hill            | Smarter Choices car share / car club schemes   | Modal Shift from Car         | 6% transfer of trips, from car-available person-trip O-D matrix to non-car-available, by each journey purpose group; the matrix adjustment will be applied to all zones in Burgess Hill.   |
| East Grinstead          | Smarter Choices - Area-wide Travel Plans (multi-stakeholder approach - not site specific) and establishment Transport Management Associations (TMAs) to implement their delivery | 6% mode Shift from Car       | 6% transfer of trips, from car-available person-trip O-D matrix to non-car-available, by each journey purpose group; the matrix adjustment will be applied to all zones in East Grinstead. |

**Table 18: MSTS Primary Remedial Transport Interventions**

| <b>General Location</b> | <b>Description</b>   | <b>Type of Scheme</b>   | <b>MSTS Modelling Assumptions</b>  |
|-------------------------|--|---|--|
| East Grinstead          | Controlled Parking Zone (CPZ) review for East Grinstead - potential extensions | Car Parking Regulations – Assumed doubling of long stay charges | Highway parking charge increase, applied to all land uses and trip purposes within East Grinstead town centre zones only; the charge increase is £6, i.e. doubling of the typical, all-day charge. |

#### **4.4. Secondary Remedial Interventions**

- 4.4.1. Table 19 indicates the Secondary Remedial interventions that have been assessed in Development Case (3).

**Table 19: MSTS Secondary Remedial Transport Interventions**

| <b>General Location</b> | <b>Description</b>  | <b>Type of Scheme</b>   | <b>MSTS Modelling Assumptions</b>  |
|-------------------------|---|---|--|
| Burgess Hill            | A273 Jane Murray Way extension (further modelling work required), between London Road and Keymer Road   | Highway Improvement   | A273 extension as single 2-lane all-purpose carriageway (40mph), with intermediate access roundabout, between B2036 London Rd/Jane Murray Way and B2113 Keymer Rd/Folders La. Assume terminal roundabouts with 2-lane approaches on all arms.  |
| Burgess Hill            | Additional bus service frequency and route connectivity enhancements, combined with sustainable transport links, improved passenger / parking facilities at bus / rail interchange. | Bus Route Connectivity – New routes and services, with higher frequency than in primary interventions | Higher frequency, new, local bus services connecting:<br>Kingsway development - B2113 - Burgess Hill Stn - Mill Rd - Leylands Rd - B2036 - N Arc - Wivelsfield Stn - Junction Rd - Cants La (2-way; 20-min headway).<br>A2300 Business Park and Northern Arc development - Wivelsfield Stn - Junction Rd - Burgess Hill Stn - B2113 - Victoria Rd - Charles Av - A273 JMW (2-way; 10-min headway). |

**Table 19: MSTS Secondary Remedial Transport Interventions**

| <b>General Location</b> | <b>Description</b>   | <b>Type of Scheme</b>   | <b>MSTS Modelling Assumptions</b>  |
|-------------------------|--|---|--|
| Ansty                   | A272 localised traffic calming through Ansty village, to mitigate the impact of future developments in Burgess Hill and Haywards Heath   | Highway Traffic Restraint, such as signing, line-marking and reduced speed limit, giving 25% speed reduction and 20% capacity reduction | 30mph speed limit and capacity constraint on A272 through Ansty village  |
| Burgess Hill            | A2300 full widening to dual 2-lane carriageway A23 - A273  | Highway Improvement   | Dual 2-lane all-purpose carriageway with 3-lane junction approaches and 60mph speed limit, between A23 at Hickstead and A273 Jane Murray Way.  |
| Burgess Hill            | A273 Jane Murray Way other junction enhancements (x4 junctions)  | Highway Junction Improvement  | Approach capacity improvements (3 lanes) at A273 roundabouts:<br>A273 / Sussex Way;<br>A273 / Malthouse Lane;<br>A273 / York Road;<br>A273 / Charles Avenue.                                       |
| Burgess Hill            | B2112 / Janes Lane junction – potential signal control   | Highway Junction Improvement  | Traffic signals with localised widening to give increased approach capacity on all arms from single to two lanes   |
| Haywards Heath          | Parking Strategy Aim - Provision of a CPZ (dependent on regeneration scheme) to address issue of lack of off-street parking in Haywards Heath (long-term aspirational) - follow up review to be undertaken | Car Parking Regulations   | Highway parking charge increase, applied to all land uses and trip purposes within Haywards Heath town centre zones only; the charge increase is £6, i.e. doubling of the typical, all-day charge. |
| Haywards Heath          | Bus Scheme - Improved bus / rail interchange at Haywards Heath railway station   | Bus Route Connectivity – Existing routes with 10-minute frequency   | Increased bus frequency (10 min headway) for services accessing central Haywards Heath, i.e. through junction of B2038 Perrymont Rd / Market Pl / Mill Green Rd / Sydney Rd.                       |

- 4.4.1. It should be noted that no smarter choices initiatives have been identified by WSCC, in Haywards Heath, for inclusion in any of the remedial intervention cases.

## 4.5. Model Assignment Packages

- 4.5.1. The forecast demand components, noted in section 3.2, have been combined in various combinations with the future transport interventions, noted in section 4.1, to produce the MSTS model assignment packages shown in Table 20.

| Table 20: Summary of MSTS Model Assignment Packages |  |                |                      |                      |                      |
|---|--|----------------|----------------------|----------------------|----------------------|
|   | Model Assignment Package AM Peak 2021 and 2031 |                |                      |                      |                      |
|   | Baseline                                       | Reference Case | Development Case (1) | Development Case (2) | Development Case (3) |
| <b>Demand Components</b>                            |  |                |                      |                      |                      |
| Committed Development                               | Yes  | Yes            | Yes                  | Yes                  | Yes                  |
| Strategic Development                               | No   | No             | Yes                  | Yes                  | Yes                  |
| Neighbourhood Plan Development                      | No   | No             | Yes                  | Yes                  | Yes                  |
| <b>Intervention Scenarios</b>                       |  |                |                      |                      |                      |
| Committed Schemes                                   | Yes  | Yes            | Yes                  | Yes                  | Yes                  |
| Primary remedial Schemes                            | No   | No             | No                   | Yes                  | Yes                  |
| Secondary Remedial Schemes                          | No   | No             | No                   | No                   | Yes                  |

- 4.5.2. The packages shown in Table 20 have been assessed using the MSTS AM peak model at 2021 and 2031.
- 4.5.3. It is anticipated that Development Case (2), with primary remedial interventions only, is the most credible outcome, at present, because it entails modest mitigation of development impacts, but not more onerous remedial schemes, such as traffic restraint on A272 through Ansty village, or extension of A273 Jane Murray Way between London Road and Keymer Road in Burgess Hill.
- 4.5.4. For ease of analysing the MSTS outputs, development Case (2) has been focussed upon as the main scenario for examination in this report.

**Project Name:** Mid Sussex Transport Study

**Document Title:** MSTS Final Report

---

## 5. Model Results and Analysis

### 5.1. Introduction

- 5.1.1. The MSTS model assignment outputs have been analysed for the AM peak situation at 2021 and 2031, as far as possible in accordance with the criteria outlined in the project brief.

### 5.2. Overall Network Travel Characteristics

- 5.2.1. Appendix A1 provides a summary of the following network-wide statistics:

- Total network trips by travel mode;
- Percentage change in trips between assignment packages;
- Network travel distance;
- Network travel time; and
- Network delay.

- 5.2.2. It is not possible to provide network fuel consumption statistics, because the highway model is divided into detailed ‘simulation’ areas and less refined ‘buffer’ areas. The SATURN model cannot provide fuel consumption values for the buffer network.

#### Overall Network Trip Movements

- 5.2.3. The overall network carries around 204,000 person trips at base year 2010. It is predicted to carry in the order of 222,000 trips in the Baseline and Reference Case at 2021, increasing by around 2,000 trips to 224,000 in the Development Case. By 2031, it will carry around 227,000 trips in the Baseline and Reference Case, rising by about 4,000 trips to 231,000 in the Development Case.

- 5.2.4. At 2021, the Reference Case carries about 0.3% more trips than the Baseline, because it includes all committed developments with associated site-specific trip rates, from TRICS. The trip rates in TRICS, for a given type and scale of land use, tend to be higher than those in TEMPRO, because TRICS accounts for short-distance local journeys, which, at a district level, are ‘intra-zonal’ and hence omitted from TEMPRO. At 2031, the Reference Case carries about 0.1% fewer trips than the Baseline, because it excludes strategic development that is present within NTEM.

- 5.2.5. The Development Case always handles more trips than the Reference case, at 2021 (by about 1.0%) and at 2031 (by about 1.9%), because it includes strategic and Neighbourhood Plan land use allocations.

- 5.2.6. The trip totals in the Reference Case and Development Case are greater at 2031 than at 2021, as a consequence of phased development completion and NTEM growth outside Mid Sussex district.

#### Overall Network Mode Split

- 5.2.7. The network-wide travel mode share varies little between model packages. Most trips are made by personal vehicles. The mode share amounts to about 92% by personal vehicle and 8% by public transport, at 2021 and 2031 in all forecast situations. Unsurprisingly, the remedial interventions to encourage localised adoption of 'smarter choices' in Development Cases (2) and (3), modelled as a 6% transfer from car-available to non-car-available trips, do not have a significant impact at a wider scale.

#### Overall Network Travel Distance

- 5.2.8. Total network travel distance, by mode, does not vary greatly between packages. At AM peak 2031, the total distance travelled by all modes is in the order of 4.9m person kilometres. The respective modal shares of total distance are about 86% highway, 12.5% rail and 1.5% bus.

#### Overall Network Travel Time

- 5.2.9. Likewise, total network travel time is also very similar between packages. At AM peak 2031, the total travel time by all modes is in the order of 70,000 person hours. The respective modal shares of total time are about 81.5% highway, 15% rail and 3.5% bus.

### **5.3. Highway Trip Patterns in Mid Sussex**

- 5.3.1. From the overall MSTS forecast model for West Sussex, we have extracted highway trip movements relating to Mid Sussex only.

#### Mid Sussex Highway Network Trip Movements

- 5.3.2. At AM peak 2031, the Mid Sussex highway trip patterns in the respective Baseline, Reference Case and Development Case (1) scenarios are as follows:

##### **Baseline**

- Mid Sussex Trips as % of West Sussex County Trips: 16.2%;
- Total Mid Sussex Trips: 33,838;
- % Trips within Mid Sussex: 35%;
- % Trips to and from Mid Sussex: 65%;

##### **Reference Case**

- Mid Sussex Trips as % of West Sussex County Trips: 15.5%;
- Total Mid Sussex Trips: 32,392;
- % Trips within Mid Sussex: 34%;
- % Trips to and from Mid Sussex: 66%;

### **Development Case (1)**

- Mid Sussex Trips as % of West Sussex County Trips: 17.1%;
  - Total Mid Sussex Trips: 36,263;
  - % Trips within Mid Sussex: 36%
  - % Trips to and from Mid Sussex: 64%
- 5.3.3. It can be seen that the volume of Mid Sussex highway trips, as a proportion of total movements in West Sussex, is greatest in Development Case (1), slightly less in the Baseline (about 2,400 trips fewer) and least in the Reference Case (about 3,900 trips fewer).
- 5.3.4. Although Development Case (1) produces more vehicle trips for Mid Sussex than either the Baseline or the Reference Case, a larger proportion of these Mid Sussex trips (36%) remains internal to the district and does not have a broader, county-wide, impact.

### **5.4. Development Case Strategic Land Uses**

- 5.4.1. We have analysed the trip patterns associated with planned strategic development sites in Burgess Hill, in the following respects:
- Percentage split of site trips, by highway and PT;
  - Total highway vehicle kilometres, for site trips;
  - Orientation of trips by geographical sector; and
  - Contribution of site traffic volume to total network traffic volume.
- 5.4.2. However, it was not possible to evaluate the following item:
- Total vehicle trip length, for site trips, by road category.
- 5.4.3. This item has been omitted, because each trip assigned in the MSTS model travels on many different types of road. It is not feasible to undertake the lengthy and complicated analysis needed to consolidate the large amount of data involved.
- 5.4.4. In Appendix A2, there is a summary of trip volumes departing from and arriving at the strategic development sites in Burgess Hill, by travel mode, together with a breakdown of development trip distance by mode.

#### Trip Contribution amongst Strategic Development Sites

- 5.4.5. The contribution from each of the strategic sites to total trips generated by strategic development is similar at 2021 and 2031, amounting to 62% at Northern Arc, 29% at A2300 Business Park and 9% at East of Kingsway.
- 5.4.6. In Development Case (1), at AM peak 2031, the two-way trip totals at each of the strategic development sites are predicted to be as follows:
- A2300 Business Park – 1,385 person trips;
  - East of Kingsway – 417 person trips; and

- Northern Arc – 2,902 person trips.

5.4.7. The site trip totals reduce slightly at East of Kingsway and Northern Arc, in Development Case (2 and 3), but increase at A2300 Business Park, because of the outcome from the destination choice model. This allows trips to change destination, based upon changes in travel cost arising from mitigation schemes. Consequently, the model can add or remove trips to and from the strategic sites, relative to the initial site-specific trip patterns calculated for each development.

#### Modal Split of Strategic Development Trips

5.4.8. The predicted mode split of strategic development trips is similar between sites and mainly comprises highway movements. In Development Case (1), with no impact mitigation, the split is 96% highway and 4% public transport. With mitigation (2 and 3), the PT share increases to 10%, whilst the highway share falls to 90%. This modal shift of strategic development trips to PT reflects the assumption that smarter choices initiatives will be implemented in Burgess Hill and East Grinstead, encouraging a 6% shift away from private car use. Although it is probable that smarter choices might also be supported in Haywards Heath, this intervention has not been modelled, as it was not identified by WSCC as a primary or secondary intervention and because no strategic development has been allocated here in the model.

5.4.9. The modal shift to PT is also a consequence of the assumed improvements in PT accessibility, service level and interchange facilities in Burgess Hill, with Development Case (2 and 3). Owing to the coarse representation, in the strategic model, of the highway network and PT operations within Burgess Hill, it is possible that the model underestimates the impact of PT interventions. More detailed modelling within the town could show more complex patterns of highway congestion and, hence, greater attraction of development trips on to bus services, if bus frequency and route coverage are improved.

5.4.10. Trips that are attracted to PT, in Development Case (2 and 3), cause a significant 3% increase in the overall proportion of AM peak journeys made by PT, to 11.5%, across Mid Sussex as a whole. However, the absolute number of Mid Sussex PT journeys in the AM peak remains relatively small in Development Case (2 and 3), at 4,240 trips, representing an increase of 1,090 PT trips from the pre-intervention situation.

#### Travel Distance of Strategic Development Trips

5.4.11. In Appendix A3, there is a summary of highway network distance travelled by trips associated with the strategic development sites in Burgess Hill. The contribution from each of the strategic sites to total highway travel distance is similar at 2021 and 2031, amounting to 60% at Northern Arc, 31% at A2300 Business Park and 9% at East of Kingsway. These proportions mirror the split of development trips contributed by each of the sites.

### Orientation of Strategic Development Trips

- 5.4.12. An analysis of the orientation of highway vehicle trips from and to each of the strategic development sites is shown in Appendix D, for Development Case (1) at AM peak 2031. A similar outcome would be expected to arise with Development Case (2 and 3). The patterns of departures (origins) and arrivals (destinations), at the respective sites, are as follows:
- A2300 Business Park: 14% departures (157 trips) and 86% arrivals (978 trips);
  - East of Kingsway: 85% departures (252 trips) and 15% arrivals (45 trips); and
  - Northern Arc: 85% departures (1,763 trips) and 15% arrivals (316 trips).
- 5.4.13. These patterns are consistent with the respective land uses, whereby, for the residential uses at Northern Arc and East of Kingsway, the major AM movement is away from the developments. Conversely, for the employment uses at A2300 Business Park the dominant AM peak movement is towards the site.
- 5.4.14. The proportion of AM peak departures from the Business Park seems quite high for an employment site, at 14%. However, this is consistent with the envisaged mix of land uses, which comprises:
- 30% light industry (business park);
  - 25% office;
  - 17% research and development;
  - 15% warehousing; and
  - 13% general industry.
- 5.4.15. From this employment mix, there will be numerous vehicles, leaving the site in the AM peak, that are associated with incoming and outgoing deliveries and work's business.
- 5.4.16. Zones in the MSTS model have been aggregated into a smaller number of sectors, to enable analysis of trip orientation. The built-up area zones of Burgess Hill, (including prospective development), have been aggregated into four sectors, representing Burgess Hill, Northern Arc, East of Kingsway and A2300 Business Park, respectively. Taken together, these four sectors have been termed 'Burgess Hill – urban'. The proportion of total site trips, at each development, accounted for by movements inside and outside 'Burgess Hill – urban', respectively, is shown below.
- From A2300 Business Park: 34% internal; 66% external;
  - To A2300 Business Park: 24% internal; 76% external;
  - From East of Kingsway: 19% internal; 81% external;
  - To East of Kingsway: 34% internal; 66% external;
  - From Northern Arc: 19% internal; 81% external; and
  - To Northern Arc: 35% internal; 65% external.

- 5.4.17. It can be seen that for the dominant AM directions of movement, (i.e. departures from Northern Arc and East of Kingsway and arrivals at the Business Park), local trips within Burgess Hill – urban account for around 20 – 25% of flows. In the non-peak travel direction, (i.e. arrivals at Northern Arc and East of Kingsway and departures from the Business Park), local trips constitute about 34 – 35% of flows. Conversely, movements outside Burgess Hill – urban account for about 75 – 80% of trips in the peak direction and 65 – 66% of trips in the non-peak direction.
- 5.4.18. There is likely to be an aspiration to maximise the proportion of internal Burgess Hill trips at the A2300 Business Park. This should be achievable, if appropriate initiatives are pursued in terms of household, workplace and personal travel planning and maximising local accessibility between land uses, for example by pedestrian and cyclist routes and reliable PT facilities.
- 5.4.19. Table 21 gives a breakdown of the main directional movements made by external trips from and to the strategic development sites in Burgess Hill.

**Table 21: Directional Movement of External Trips at Burgess Hill Strategic Development Sites**

| Movement Direction  | % of External Trip Destinations from Each Site | No. of External Trip Destinations from Each Site | % of External Trip Origins to Each Site | No. of External Trip Origins to Each Site |
|---|--|--|---|---|
| <b>A2300 Business Park</b>  |  |  |   |   |
| North & North West (Incl. Crawley, Haywards Heath & East Grinstead) | 26.4%  | 41   | 35.2%                                   | 344                                       |
| West, South West & South  | 31.9%  | 50   | 32.4%                                   | 317                                       |
| Comprising  | West & South West                              | 22.9%  | 36                                      | 24.3%                                     |
|   | South (Brighton & Hove)                        | 9.0%   | 14                                      | 8.1%                                      |
| North East, East and South East                                     | 8.0%   | 13   | 8.4%                                    | 82  |
| Residual, retained within Burgess Hill                              | 33.7%  | 53   | 24.0%                                   | 235                                       |
| <b>East of Kingsway</b>   |  |  |   |   |
| North & North West (Incl. Crawley, Haywards                         | 30.3%  | 76   | 28.8%                                   | 13  |

**Table 21: Directional Movement of External Trips at Burgess Hill Strategic Development Sites**

| Movement Direction  | % of External Trip Destinations from Each Site | No. of External Trip Destinations from Each Site | % of External Trip Origins to Each Site | No. of External Trip Origins to Each Site |
|---|--|--|---|---|
| Heath & East Grinstead)   |  |  |   |   |
| West, South West & South  | 37.8%  | 95   | 26.7%                                   | 12  |
| Comprising  | West & South West                              | 26.1%  | 65                                      | 18.3%                                     |
|   | South (Brighton & Hove)                        | 11.7%  | 30                                      | 8.4%                                      |
| North East, East and South East                                     | 13.3%  | 34   | 10.7%                                   | 5   |
| Residual, retained within Burgess Hill                              | 18.5%  | 47   | 33.7%                                   | 15  |
| <b>Northern Arc</b>   |  |  |   |   |
| North & North West (Incl. Crawley, Haywards Heath & East Grinstead) | 33.5%  | 590  | 30.8%                                   | 97  |
| West, South West & South  | 36.9%  | 651  | 26.0%                                   | 82  |
| Comprising  | West & South West                              | 26.7%  | 472                                     | 19.2%                                     |
|   | South (Brighton & Hove)                        | 10.2%  | 179                                     | 6.8%                                      |
| North East, East and South East                                     | 10.4%  | 184  | 8.1%                                    | 25  |
| Residual, retained within Burgess Hill                              | 19.2%  | 338  | 35.1%                                   | 111                                       |

- 5.4.20. For the dominant AM directions of movement, it can be seen that 30 – 35% of residential trip departures and employment arrivals travel between Burgess Hill and areas to the North and North West. A further 32 – 38% travel between Burgess Hill and areas to the West, South West and West. The remaining 8 – 13% travel between Burgess Hill and areas to the North East, East and South East.

- 5.4.21. The above patterns reveal a fairly even split of strategic development trips between areas north and south of Burgess Hill, but a significant dominance of movements to westwards rather than eastwards of the town.
- 5.4.22. Strategic trips to and from Brighton (south) account for about 10 – 12% of residential departures and 8% of employment arrivals at the Burgess Hill sites.
- 5.4.23. A diagrammatic display of the orientation of trip movements to and from the strategic development sites in Burgess Hill, is provided in Appendix D, separately by site and by arrival / departure. The bandwidths reflect the volume of trips making each movement at a sector level.
- 5.4.24. A comparison has been made between the predicted orientation of strategic development trips in Burgess Hill and journey to work patterns from the 2001 census. Results are shown in Table 22. They indicate that the journey to work pattern from Burgess Hill is broadly comparable between the two strategic residential sites (Northern Arc and East of Kingsway) and the 2001 Census. They also indicate that the journeys to work pattern to Burgess Hill is similar between the strategic employment sites (A2300 Business Park) and the Census.

**Table 22: 2001 Census Journey To Work: Trip distribution from and to Burgess Hill**

| Movement Direction  | % of External Trip Destinations from Burgess Hill | No. Census JTW trips starting from Burgess Hill | % of External Trip Origins to Burgess Hill | No. Census JTW trips ending in Burgess Hill |
|---|---|---|--|---|
| North & North West (Incl. Crawley, Haywards Heath & East Grinstead) | 46%   | 4,007   | 23%  | 1,940                                       |
| West, South West & South  | 17%   | 1,525   | 34%  | 2,931                                       |
| Comprising  | West & South West                                 | 5%  | 412  | 10%   |
|   | South (Brighton & Hove)                           | 12%   | 1,113                                      | 24%   |
| North East, East and South East                                     | 8%  | 693   | 13%  | 1,164                                       |
| Residual, retained within Burgess Hill                              | 29%   | 2,529   | 30%  | 2,529                                       |
| All Movements at Burgess Hill                                       | 100%  | 8,754   | 100%                                       | 8,564                                       |

- 5.4.25. We have compared the MSTS and Census results in approximate (rounded) proportions. For home-based trips leaving Burgess Hill, the MSTS model shows an even 35% split of journeys going to each of the north / northwest and the west / southwest / south areas, whereas the Census shows 45% and 20% for these movements, respectively. Internal trips account for about 20% of movements in the MSTS and 30% in the Census. The remaining 10% of trips in the MSTS and 5% in the Census, travel to areas to the east of Burgess Hill.
- 5.4.26. For non-home-based trips arriving in Burgess Hill, the MSTS model shows 35% of journeys coming from the north / northwest and 30% coming from the west / southwest / south, whereas the Census shows 25% and 35% for these movements, respectively. Internal trips account for about 25% of movements in the MSTS and 30% in the Census. The remaining 10% of trips in the MSTS and 10% in the Census, travel from areas to the east of Burgess Hill.
- 5.4.27. The proportion of AM peak Burgess Hill strategic home-based trips travelling to Brighton (i.e. south) is similar in the MSTS model (about 11%) to the Census (about 12%). However, the proportion of AM peak Burgess Hill strategic non-home-based trips travelling from Brighton is lower in the MSTS model (about 8%) than in the Census (about 24%).
- 5.4.28. Differences between the MSTS and Census journey to work trip distributions are likely to reflect the following:
- The old age of the Census data, which overlooks changes in land use patterns;
  - The strategic nature of the MSTS model, which causes a slight underestimate of internal trip movements within Burgess Hill and other urban areas; and
  - The inclusion of all journey purposes within MSTS trip patterns and not just journeys to work, as in the Census.

#### Strategic Development Contribution to Highway Network Traffic

- 5.4.29. Further analysis has been undertaken of the proportions of highway vehicle movements, on key road links, which are attributable to the strategic development sites. Findings are shown in Appendix A6-A13. Road links have been selected for analysis according to the core highway network shown in Appendix A22. The links indicated on the drawing have been allocated a reference, which is annotated against the model outputs in Appendix A, so that locations can be identified.

- 5.4.30. The contributory flow proportions are summarised for each development, separately (in Appendices A10-A12) and also for all strategic sites combined (in Appendix A13). The table has been colour-coded to indicate links on which the overall ratio of flow to capacity (RFC) is at a critical level (according to the total link flow analysis, which is referred to later and shown in Appendix A14). Hence, the results can be used to identify links on which strategic development traffic contributes a significant proportion of flow and where overall flow is close to capacity.
- 5.4.31. Considering the flows arising from all strategic developments combined (Appendix A9 and A13), at AM peak 2031, some notable impacts can be identified. These do not constitute impacts that necessarily require mitigation by developers. These impacts are as follows:
- Maximum strategic development contribution to individual link flow is 85% on the Northern Arc Spine Road in Development case (3);
  - Maximum strategic contribution to flow on existing links is 58% on the B2036 between A273 and A272 in Development case (2);
  - Key road links on which the developments contribute a significant proportion of total traffic flow, (judged, for analysis purposes, to be greater than 20%), across all development case assignments, include:
    - A2300 (eastbound and westbound); maximum 48% contribution;
    - A272 (westbound from B2036 to A23 and westbound from A23 to A281); maximum 44% contribution;
    - A273 (northbound from B2036 to A272, southbound from B2036 to B2116, southbound from B2116 to B2112, southbound from B2112 to A23 and westbound from B2036 to A2300); maximum 39% contribution;
    - B2116 (westbound from B2112 to A273); maximum 29% contribution;
    - B2028 (northbound from Haywards Heath to B2110); maximum 23% contribution;
    - B2115 (eastbound from B2110 to A23); maximum 23% contribution;
    - B2036 (southbound through central Burgess Hill); maximum 25% contribution;
    - Leylands Road (eastbound in Burgess Hill, from Mill Road to Junction Road); maximum 29% contribution;
    - Janes Lane (eastbound in Burgess Hill, from Junction Road to B2112); maximum 34% contribution;
    - Junction Road (northbound in Burgess Hill, from Cants Lane to Janes Lane); maximum 27% contribution;
    - B2028 (northbound in Haywards Heath, from Sydney Road to B2111); maximum 24% contribution;
    - Paddockhall Road (northbound from A272); maximum 23% contribution;

- Summerhill Road (northbound from B2028); maximum 24% contribution;
  - There is no significant strategic development impact in East Grinstead, where the maximum contribution is 5%;
  - Flow contribution on the A23 will be modest; the highest proportions of development traffic, in all development cases, will be 13% on A23 southbound, between A272 Bolney and A2300 Hickstead and 10% on A23 southbound, between A273 Pyecombe and A27 Patcham.
- 5.4.32. There are a few critical road links that will experience RFC in excess of 100%, at 2031 AM peak, according to link capacity thresholds defined by DfT, and where the strategic developments will make a significant flow contribution.
- 5.4.33. It will be a matter for the Highway Authority (WSCC) to determine if the proportion of network flow, contributed by particular developments, on links where there is likely to be congestion, requires mitigation by a particular party (e.g. a site developer). The DfT 'Guidance on Transport Assessment' (March 2007) advises that previous thresholds of significant development impact (i.e. 10% flow increase on local roads, or 5% increase on trunk roads) are no longer applicable.
- 5.4.34. Congested road links in the MSTS area, on which there is likely to be a significant flow contribution from development traffic, are as follows:
- A2300 eastbound; RFC >100% in Development Case 2 (with Northern Arc Spine Road and no A2300 dual carriageway); 47% flow contribution;
  - A2300 westbound; RFC >100% in Development Case 1 (with no Northern Arc Spine Road and no A2300 dual carriageway); 35% flow contribution;
  - Problems on the A2300 can be resolved by widening the A2300 to dual 2-lane carriageway in Development Case (3), but will also require provision of a more satisfactory junction layout at the intersection of A2300 / Northern Arc spine / A2300 Business Park access;
  - A272 eastbound from A273 to B2028, Haywards Heath; RFC >100% in all Development Cases; maximum 15% flow contribution;
  - No mitigation scheme has, at this stage, been devised to remedy the congestion;
  - B2113 westbound, between Keymer Road and Civic Way; RFC >99% (but without severe congestion) in Development Case (1 and 2); maximum 5% flow contribution;
  - Potential problems on the B2113 could be resolved by introducing the A273 Jane Murray Way extension between London Road and Keymer Road in Development Case (3); however, this intervention will be very onerous to deliver and may well be unnecessary if more traffic can be encouraged to use the Northern Arc spine route around the north side of the town, once satisfactory access arrangements on A2300 are devised.

- 5.4.35. It is reasonable to assume that, for many links where RFC exceeds 100% and there is a significant development contribution to the traffic flow, there will also be junction congestion problems on those links. At some of these junctions, possible mitigation schemes have already been identified and tested as being satisfactory in the MSTS model, for example at A23 / A2300 Hickstead junction, in Development case (2 and 3).
- 5.4.36. However, some further analysis needs to be undertaken to verify where development makes a significant contribution to junction congestion and to test if intervention will resolve the problem.

## **5.5. Highway Analysis of Key Links and Junctions**

- 5.5.1. Analysis of MSTS model outputs has been carried out, to show conditions of traffic flow and network performance at AM peak 2021 and 2031 and the changes in conditions that will occur between the various assignment scenarios. This analysis does not focus upon the impact of particular strategic development proposals, but indicates the overall outcome with different levels of strategic and neighbourhood plan development and with different interventions.
- 5.5.2. We have identified a number of links and junctions on the highway network, for which it is appropriate to analyse the assignment outputs from the MSTS model. A plan of the selected road links is shown in Appendix A22 and a plan of selected junctions is provided in Appendix A21. Key links and junctions have each been given a location reference, which is also annotated against the tabulated model outputs.
- 5.5.3. Highway links have been categorised according to their strategic importance, as follows:
- Motorway;
  - Strategic 'A' Class Trunk Route;
  - Primary 'A' Class Road;
  - Secondary 'A' Class Road;
  - 'B' Class Road; and
  - Town Centre Link.
- 5.5.4. The following items of model output have been extracted and analysed for key links and junctions:
- Link Traffic flows (and change from Reference Case);
  - Junction Turning Flows;
  - Average delay per vehicle on busiest junction approach;
  - Ratio of link flow to capacity; and
  - Ratio of junction turning flow to capacity (for busiest junction arm).

### Highway Network Link Flows

- 5.5.5. In Appendix A4 there is a summary of assigned highway link flows from each of the various MSTS model run packages (Base Year, forecast Baseline, forecast Reference Case and forecast Development Cases 1 – 4). The forecast flows are given in vehicles per hour for the AM peak at 2021 and 2031. These are ‘actual’ flows, which represent only vehicles that arrive at a particular point on the network during the modelled hour and not vehicles that are held back in queues elsewhere. They are not ‘demand’ flows, which represent the total traffic travelling between each origin and destination zone, regardless of network queues.
- 5.5.6. Each of the forecast Baseline and Development Case link flows in Appendix A4 has been compared with the Reference Case at the equivalent year (2021 or 2031), to give a percentage change in traffic volume. The Reference Cases at 2021 and 2031 have each been compared with the Base Year 2010 flows. The results are shown in Appendix A5. We have colour-coded each flow change, relative to the reference case, as follows:
- Green – flow change between -0.9% and +0.9%;
  - Blue – flow change between -1% and -4.9%, or between +1% and +4.9%;
  - Amber – flow change between -5% and -9.9%, or between +5% and +9.9%;
  - Red – flow change less than -10%, or greater than +10%.
- 5.5.7. Changes in flow in the Reference Case, relative to base year 2010, are very similar at 2021 and 2031. This is because traffic associated with 100% of committed residential and employment sites has been included in both Reference Case years. In addition, background traffic growth in Mid Sussex arising from NTEM plan forecasts has been largely removed from each Reference Case, as agreed.
- 5.5.8. The majority of selected links have flow increases in the Reference Case of more than 10%, from base year, at both 2021 and 2031.
- 5.5.9. Patterns of link flow change in the MSTS assignment packages are extremely complex and difficult to explain in simple terms, because they reflect a number of related factors, for example:
- Development site trip patterns in Burgess Hill;
  - Notional layout and capacity of highway improvements;
  - County-wide re-assignment of traffic between a multitude of zone origins and destinations;
  - Impact of PT enhancement and car parking regulations in Burgess Hill; and
  - Changes in trip patterns calculated by the MSTS mode choice and destination choice model.
- 5.5.10. Noteworthy flow changes, on key roads where there is significant change, (i.e. 10% or more), between the Reference Case and Development Case (2), at AM peak 2031, (as shown in Appendix A5), are summarised below:

- A23 southbound, A272-A2300: +13%, in DC2, 3;
- A23 southbound, A273-A27: +10%, in DC2, 3;
  - These increases are solely a reflection of the quantity of development traffic travelling southbound towards the Business Park and away from the residential sites in Burgess Hill, respectively;
- A22 southbound, from A275: +12%, in DC2;
  - This increase reflects congestion passing around Burgess Hill, eastbound;
- A2300 eastbound, A23-A273: +70% in DC2, 3;
- A2300 westbound, A273-A23: -24%, in DC2, 3;
  - This decrease is caused by congestion and delay at the assumed access roundabout on the A2300, connecting with the Northern Arc spine road and the Business Park; more effective access arrangements, here, could result in significant flow increase on A2300 westbound;
- A272 eastbound, A23-B2036: +34%, in DC2 and 3;
- A272 westbound, B2036-A23: +52%, in DC2 and 3;
  - These reflect the discouragement of traffic from using the Northern Arc spine road and A2300, westbound, when insufficient capacity is provided by the single development access roundabout on A2300;
- A2037 northbound and southbound, A281-A283: +10%/+15%, in DC2, 3;
- A281 southbound, Horsham-A272: +20%, in DC2, 3;
- A281 northbound, A23-A2037: +15%/+20%, in DC2 and 3;
- A273 southbound, Burgess Hill-A23: +30%, in DC2, 3;
- A273 Sussex Way eastbound and westbound, A2300-B2036: -70%/-60%, in DC2, 3;
  - This is a result of downgrading Sussex Way;
- A273 Isaacs Lane northbound, B2036-A272: +30%, in DC2;
- A273 Isaacs Lane southbound, A272-B2036: -15%, in DC2;
  - This reduction is caused by congestion and delay at the A2300 junction with Northern Arc and Business Park sites;
- A273 Jane Murray Way southbound and northbound: -15%/-30%, in DC2;
- B2036 London Road, northbound and southbound: -10% or more, except at northern end, in DC2;

- These unexpected flow reductions on A273 and B2036 around Burgess Hill reflect the deterrent to through traffic caused by the downgrade of Sussex Way, the restraint of traffic on A273 and B2036, to the north, improvements in capacity on A23, and the need for additional junction capacity at A2300 / Northern Arc / Business Park junction, in all development cases (1, 2 and 3); it is also caused by mode shift from car to PT for trips in Burgess Hill, where PT facilities are improved and by increases in car parking charges in the town;
- B2113 Station Road eastbound and westbound: +15%/+10%, in DC2;
- This increase is mitigated in DC3, by the extension of A273 Jane Murray Way linking London Road and Keymer Road;
- Leylands Road and Janes Lane eastbound: +40%/+50%, in DC2;
- B2036 northbound, A273-A272: +80% in DC2, 3;
- B2036 northbound from and southbound to Cuckfield: +7%, in DC2;
- A275 northbound, A272-A22: +10%, in DC2, 3;
- A275 southbound, A272-B2116: +17%, in DC2;
- Haywards Heath Relief Road, Eastern section, eastbound and westbound: -35%/-45%;
- Haywards Heath Relief Road, Western section, eastbound and westbound: -5%/-40%;
- These flow reductions are probably caused by congestion arising from inadequate provisional junction design capacity along the relief road;
- B2116 westbound, A273-B2117: +75%, in DC2, 3;
- B2116 westbound, B2117-A281: +30%, in DC2;
- B2112 northbound and southbound, B2113-B2116: +10%, in DC2;
- B2117 southbound, B2116-A23 and A281: +20% in DC2, 3; and
- B2028 northbound from Haywards Heath: +25%, in DC2, 3.

#### Highway Network Junction Turning Flows

- 5.5.11. Turning movements at key road junctions have been extracted from the MSTS model assignments. The junctions for which flows have been analysed and the appendices containing the corresponding flow diagrams, are as follows:
- A272 / B2036 Ansty (Appendix B1);
  - A273 Sussex Way / B2036 London Road (Appendix B2);

- B2113 Folders Lane / B2112 Ditchling Common (Appendix B3);
  - B2112 / B2116 Ditchling (Appendix B4);
  - A273 Jane Murray Way / B2036 London Road (Appendix B5);
  - A23 / A2300 Hickstead Interchange (Appendix B6); and
  - A23 / A272 Bolney Interchange (Appendix B7).
- 5.5.12. Turning flows at these junctions are specified in PCU per hour, for the AM peak at 2021 and 2031 respectively, for each of the six forecast assignment packages and for base year 2010.
- Average Junction Delays
- 5.5.13. At the selected road junctions identified in the diagram in Appendix A21, we have extracted the average delay per vehicle on the busiest approach, from the MSTS model. Again, the delays are specified for each forecast assignment package, in Appendix A18.
- 5.5.14. Comparison has been made between the delays in respective packages with those in the corresponding Reference Case, to give a percentage change in delay. Reference case delays at 2021 and 2031 have been compared with the Base Year delays.
- 5.5.15. The results are shown in seconds of delay in Appendix A19. We have colour-coded each delay change, relative to the reference case, as follows:
- Green – delay change between -0.9 minutes and +0.9 minutes;
  - Blue – delay change between -1 minute and -1.9 minutes, or between +1 minute and +1.9 minutes;
  - Amber – delay change between -2 minutes and -4.9 minutes, or between +2 minutes and +4.9 minutes;
  - Red – delay change less than -5 minutes, or greater than +5 minutes.
- 5.5.16. It is clear from the findings in Appendix A19 that changes in average highway junction delay, in the assignment packages, are not predicted by the model to be greater than 1 minute from the Reference Case, in almost all key locations, at 2031 AM peak.
- 5.5.17. Locations where significant delay changes (of more than 1 minute) are predicted to occur are as follows:
- A23 / B2118 interchange Sayers Common: +1.8 minutes, in DC2, 3;
  - A272 / B2036 Ansty: +2.2 minutes, in DC2;
  - A272 / A273 Bolnore: +1.5 minutes in DC2, 3;
  - A2300 / Northern Arc / Business Park access roundabout: +4.5 minutes, in DC2, 3;

- This delay can probably be resolved by signalising the junction layout; however, the roundabout configuration causes severe problems, because the heavy traffic flow that uses the eastbound right turn from A2300 to the Business Park, blocks all traffic leaving Northern Arc on the westbound approach from the spine road and traffic approaching westbound from A273 Jane Murray Way; an alternative intervention might be an extension of the Northern Arc spine to the south and east from A2300 to A273 Jane Murray Way, with a revised access for the Business Park, but this could still suffer delays from traffic entering the Business Park from A2300 eastbound;
  - B2112 / Rocky Lane / Haywards Heath Relief Road: +2.7 minutes, DC2, 3;
  - Again, this delay problem can probably be resolved by refining the design of the relief road roundabout.
- 5.5.18. Although the MSTS model gives a reasonable representation of junction delays, a more reliable indicator of congestion problems is the RFC on the busiest junction arm.
- Highway Link Ratio of Flow to Capacity
- 5.5.19. For selected network links, we have compared the modelled flows in Appendix A4 with the road capacity, as calculated using the following guidelines from Design Manual for Roads and Bridges (DMRB):
- Rural road links – DMRB Volume 12, Section 2, Part 1: ‘Traffic Appraisal in Urban Areas’, Appendix E – Speed/Flow Relationships (these are consistent with COBA); and
  - Urban road links – DMRB Volume 5, Section 1, Part 3: TA 79/99 ‘Traffic Capacity of Urban Roads.
- 5.5.20. The resulting ratios of flow to capacity (RFC) for selected links are summarised in Appendix A14. The RFC values have been colour-coded according to the following criteria:
- Green – RFC below 75%;
  - Light Amber – RFC between 75% and 84.9%;
  - Amber – RFC between 85% and 99.9%; and
  - Red – RFC above 100%.
- 5.5.21. It is considered that RFC between 85% and 100% gives cause for concern, as the link could become oversaturated with traffic during short peaks in demand, resulting in limited congestion and delays. However, RFC greater than 100% indicates a significant problem, because it will definitely entail congestion.

5.5.22. In Appendix A15, we have filtered out just those road links where RFC is predicted to exceed 75% in at least one assignment package. From the results, we have identified links where excessive stress will arise in the Development Cases (1, 2, or 3), but will not arise in the Reference Case, in order to determine a need for mitigation. The results indicate the following outcomes at 2031 AM peak:

- A23 northbound flows will be within link capacity but with RFC of around 90%, between A273 Pyecombe and A272 Bolney, in all situations including the Reference Case;
- A264 RFC each way will exceed 100% between A2220 Copthorne and B2028, in all situations including the Reference Case;
- No mitigation scheme has, at this stage, been devised to remedy the congestion;
- A22 southbound flows will be within capacity, but with RFC of around 90%, north of A264 Felbridge, in all situations including the Reference Case;
- A2300 RFC will exceed 100% eastbound In DC1 and 2, but not in the Reference Case or Baseline;
  - This is a consequence of strategic development in Burgess Hill, but can be mitigated by widening A2300 to dual carriageway in DC3;
  - A2300 RFC will exceed 100% westbound In DC1, but not in DC2, the Reference Case or Baseline;
  - Again this is a consequence of strategic development in Burgess Hill, which can be mitigated by widening A2300 to dual carriageway in DC3; the problem is also likely to be present in DC2, but is masked by congestion at A2300 / Northern Arc / Business Park roundabout, which requires an improved junction layout;
- A272 RFC will exceed 100% eastbound, between A273 Bolnore and B2028 Haywards Heath, in all situations including the Reference Case;
- A273 RFC will exceed 100% northbound, between A23 Pyecombe and B2112 Clayton, in DC1 and will reach between 90% and 100% in all other situations including the Reference Case;
  - Intervention schemes in DC2 will mitigate this problem, by reducing the traffic demand on A273 south of Burgess Hill;
- A277 RFC will exceed 100% southbound, between A275 and A27 Lewes, in all situations including the Reference Case;
- B2110 RFC will exceed 85% southbound, between B2115 and A281 Lower Beeding, in all situations except the Reference Case and Baseline;
- B2115 RFC will exceed 80% westbound, between B2036 Cuckfield and B2114, in all situations including the Reference Case and Baseline;

- B2113 RFC will exceed 100% westbound, between Junction Road and London Road in Burgess Hill, in all situations, except DC3, including the Reference Case and Baseline;
- Intervention schemes in DC3 will mitigate this problem, by extending A273 Jane Murray Way between Keymer Road and London Road, thereby providing an alternative route to B2113 Station Road; the problem could also be resolved by devising an effective layout for the Northern Arc spine road intersection with A2300 and the Business Park.

#### Highway Junction Ratio of Flow to Capacity

- 5.5.23. We have also compared assigned traffic flows with capacities (saturation flows) at key junction locations, to identify points of network stress, congestion and delay. At each junction the RFC value has been extracted for the movement under greatest stress (i.e. heaviest flow in relation to capacity).
- 5.5.24. The outcomes in terms of Ratios of flow to capacity (RFC) for selected junctions are summarised in Appendix A16. The RFC values have been colour-coded according to the same criteria as for links, namely:
- Green – RFC below 75%;
  - Light Amber – RFC between 75% and 84.9%;
  - Amber – RFC between 85% and 99.9%; and
  - Red – RFC above 100%.
- 5.5.25. In Appendix A17, we have filtered out road junctions where RFC is predicted to exceed 75% in at least one assignment package. From the results at 2031 AM peak, we have identified junctions where excessive stress will arise in the Development Cases (1, 2, or 3), but will not arise in the Reference Case, in order to determine a need for mitigation. The findings can be summarised as follows:
- M23 Junction 11 / A23 interchange Pease Pottage; RFC above 100% in all situations including the Reference Case;
  - A23 / B2110 interchange Handcross; RFC between 80% and 90% in all situations including the Reference Case;
  - A23 / A272 interchange Bolney; RFC above 90% in all situations including the Reference Case;
  - A23 / B2118 interchange Sayers Common; RFC above 100% in all situations including the Reference Case;
  - A23 / A281 interchange Pyecombe; RFC above 95% in all situations including the Reference Case;
  - A27 / A283 interchange Old Shoreham; RFC around 95% in all situations including the Reference Case;

- A264 junctions at A2220 Copthorne, B2028 and A22; RFC above 100% in all situations including the Reference Case, except at B2028 where RFC only exceeds 100% in DC1, 2 and 3;
- Some capacity enhancement may be required at B2028, where the problem is development-related;
- A272 / A281 junction, Cowfold; RFC above 100% in all situations including the Reference Case;
- A272 / B2036 junction, Ansty; RFC above 100% in all situations except the Reference Case, Baseline and DC3;
- Some capacity enhancement may be required here;
- A272 / A273 junction, Bolnore; RFC above 100% in all situations except the Reference Case and Baseline;
- Some capacity enhancement may be required here;
- A272 / B2028 junction, Haywards Heath; RFC above 100% in all situations except the Reference Case and Baseline;
- Some capacity enhancement may be required here;
- A272 / B2111 junction, Haywards Heath; RFC above 100% in all situations including the Reference Case and Baseline;
- Some capacity enhancement may be required here;
- A281 / B2115 Junction, Lower Beeding; RFC above 90% in all situations including the Reference Case;
- A273 / B2112 Junction, Clayton; RFC above 90% in all situations including the Reference Case;
- A273 / B2116 (Stonepound) Junction, Hassocks; RFC above 100% in all situations including the Reference Case;
- A273 / B2036 Junction, Fairplace Bridge; RFC above 100% in DC1 only;
- Mitigation in DC2 to reduce traffic demand on A273 and B2036 will be effective in resolving this congestion;
- A275 / B2116 Junction; RFC above 100% in all situations including the Reference Case;
- A2300 / Northern Arc / Business Park junction, Burgess Hill; RFC above 100% in all situations except the Reference Case and Baseline;
- Capacity enhancements are needed in the preliminary roundabout design, to resolve the congestion problem;

- B2036 / Northern Arc junction, Burgess Hill; RFC above 95% in all situations except the Reference Case and Baseline;
  - B2112 / Haywards Heath Relief Road Junction; RFC above 100% in all situations including the Reference Case;
    - Some modifications are needed to the outline design of this roundabout;
  - B2028 / B2037 Junction; RFC about 100% in all situations including the Reference Case;
  - B2110 / B2115 Junction, Lower Beeding; RFC above 90% in all situations including the Reference Case;
  - B2110 / B2036 Junction; RFC above 80% in all situations including the Reference Case;
  - B2110 / B2028 Junction, Turners Hill; RFC above 100% in all situations including the Reference Case;
  - B2114 / B2115 junction, Slough Green; RFC above 100% in all situations except the Reference Case and Baseline;
    - Capacity enhancements may be needed, to resolve the congestion problem;
  - B2113 Folders Lane / Keymer Road junction, Burgess Hill; RFC above 100% in Development cases 2 and 3, but not DC1, the Reference Case, or Baseline;
    - Capacity enhancements may be needed, to resolve the congestion problem;
  - A272 / Paddockhall Road junction, Haywards Heath; RFC above 100% in all situations except the Reference Case and Baseline;
    - Some capacity enhancement may be required here.
- 5.5.26. The predicted pattern of junction RFC, for the Reference Case and Development Case 2 forecast scenarios, at AM peak 2031, are illustrated in Appendices A23 and A24, respectively.
- 5.5.27. In our assessment of junctions that will experience a high RFC in both the Development Cases and the Reference Case, we have identified the percentage change in RFC, from the Reference Case, which is contributed by strategic and Neighbourhood Plan development. The results are as follows:
- M23 Junction 11 / A23 interchange Pease Pottage; RFC 0% change;
  - A23 / B2110 interchange Handcross; RFC +6% increase;
  - A23 / A272 interchange Bolney; RFC +6% increase;
  - A23 / B2118 interchange Sayers Common; RFC +6% increase;
  - A23 / A281 interchange Pyecombe; RFC +3% increase;
  - A27 / A283 interchange Old Shoreham; RFC -1% decrease;

- A264 junctions at A2220 Copthorne and B2037; RFC +1% increase;
  - A272 / A281 junction, Cowfold; RFC +3% increase;
  - A281 / B2115 Junction, Lower Beeding; RFC +2% increase;
  - A273 / B2112 Junction, Clayton; RFC +8% increase;
  - A273 / B2116 (Stonebound) Junction, Hassocks; RFC +1% increase;
  - A275 / B2116 Junction; RFC 0% change;
  - B2112 / Haywards Heath Relief Road Junction; RFC +8% increase;
  - B2028 / B2037 Junction; RFC -2% decrease;
  - B2110 / B2115 Junction, Lower Beeding; RFC +7% increase;
  - B2110 / B2036 Junction; RFC +5% increase; and
  - B2110 / B2028 Junction, Turners Hill; RFC 0% change.
- 5.5.28. It is anticipated that planned development will cause a greater than 5% increase in RFC, from the Reference Case, at the following congested junctions: A23/B2110 Handcross; A23/A272 Bolney; A23/B2118 Sayers Common; B2112 Haywards Heath Relief Road; B2110/B2115 Lower Beeding; and B2110/B2036.
- 5.5.29. Performance of the road network around Ditchling is not predicted to give cause for concern. The transport model suggests that link and junction RFC will not reach critical levels, with strategic development in place, on the B2116, B2112, or Ditchling Beacon Road. At AM peak 2031, the maximum RFC values are expected to be as follows:
- B2112 north of ditchling – 50% RFC;
  - B2112 south of Ditchling – 60% RFC;
  - B2112 south of Ditchling – 60% RFC;
  - B2116 west of Ditchling – 50% RFC;
  - B2116 east of Dictchling – 55% RFC;
  - B2112 / B2116 junction, Ditchling – 60% RFC; and
  - Ditchling Beacon Road (B2116 – A27) – 66% RFC.

## 5.6. Analysis of Traffic Flows Through Ashdown Forest

- 5.6.1. The study brief required an assessment of whether or not future land use and travel patterns resulting from the policy proposals within the Mid Sussex District Plan would impact upon the local air quality of the environmentally sensitive area of Ashdown Forest Special Area of Conservation (SAC), lying to the south east of East Grinstead.
- 5.6.2. In the MSTS model we have included key roads that access or cross Ashdown Forest, namely:

- A275 (Lewes – East Grinstead);
  - A22 (Uckfield – East Grinstead);
  - A26 (Uckfield – Crowborough);
  - B2110 (East Grinstead – Royal Tunbridge Wells);
  - B2188 (Maresfield – Groombridge);
  - B2026 (B2188 – B2110); and
  - Coleman's Hatch road (East – West through Ashdown Forest).
- 5.6.3. Owing to the strategic nature of the MSTS model and the location of Ashdown Forest on the north east periphery of the network, we cannot derive meaningful flow assignments for B2188, B2026 or Coleman's Hatch Road. However, an assessment has been made of future traffic impacts on A275, A22, A26 and B2110, which pass by, or through, Ashdown Forest. The assessment represents a 'worst case' for these routes, which are modelled as carrying additional traffic that might otherwise travel on B2118, B2026 and Coleman's Hatch Road, within the SAC.
- 5.6.4. A threshold for determining significant traffic impact has been set in the Habitats Regulations Assessment, using the Department for Transport's Design Manual for Roads and Bridges (DMRB). The DMRB provides a scoping assessment for local air quality, specifically for sites expected to conform to the Habitats Directive. DMRB initially requires the identification of roads that are likely to be affected by District Plan proposals. The criteria for defining an affected road specify that a flow increase of 1,000 vehicles or more of annual average daily traffic (AADT) flow, 2-way, will constitute a significant impact.
- 5.6.5. We have applied representative local flow factors to convert the forecast AM peak hour model outputs, at 2021 and 2031, to AADT equivalent. The resulting AADT flows on the Ashdown Forest routes, for the various assignment packages, have been compared with the reference Case for the respective years. Results from the analysis are provided in Appendix C1.
- 5.6.6. It can be seen that the maximum 2-way AADT flow change from the Reference Case at 2021, around Ashdown Forest, would be 179 vehicles in DC1 (with no development mitigation) and 100 vehicles in DC2, on A275.
- 5.6.7. Similarly, the maximum 2-way AADT flow change from the Reference Case at 2031 would be 417 vehicles in DC1 (with no development mitigation) and 358 vehicles in DC2, on A275.
- 5.6.8. Flow changes on A22, A26 and B2110 and in the other assignment packages, would be less than on A275 for DC1 and DC2 at 2021 and 2031. It can be concluded that future land use and travel patterns in Mid Sussex would not cause traffic flows on the key routes to impact significantly upon Ashdown Forest.

## 5.7. Strengths and Weaknesses of the MSTS

- 5.7.1. We have considered the robustness and reliability of the findings from the Mid Sussex Transport Study. There is much strength and some weakness in the modelling approach, as discussed below.
- 5.7.2. The strategic transport model, as refined for the MSTS, is a strong tool for predicting the area-wide impacts of land use changes, site-specific developments and remedial transport scheme interventions. It represents the main determinants of network performance, namely:
- Base and forecast travel demand, by highway and PT modes and by trip purpose, between origin and destination zones;
  - Highway network characteristics, in terms of link distances, speeds and capacities and in terms of junction layouts, capacities and controls;
  - PT network, route and service characteristics;
  - Transport generalised costs by respective modes; and
  - Behavioural decisions, in terms of route choice, mode choice and trip destination choice, as determined by comparative travel costs.
- 5.7.3. We have used the WSCTM to best effect in assessing the impacts of land use and transport plans proposed by MSDC and WSCC. This has entailed a number of demand scenarios, representing: background growth from NTEM; re-allocation of planning data (households and jobs) between Mid Sussex localities, according to Neighbourhood Plan assumptions; and site-specific trips associated with committed and strategic developments.

## 6. Summary and Conclusions

- 6.1.1. We have interpreted the results from the MSTS transport model assignments, at AM peak 2021 and 2031, to draw a number of conclusions, as summarised below.
- 6.1.2. At the West Sussex County scale, there is likely to be a growth of total person trips on the transport network, in the AM peak, of 9% between 2010 and 2021 and 11% between 2010 and 2031, in the Reference Case and Baseline scenarios. Addition of strategic and Neighbourhood Plan development in Mid Sussex is likely to increase this growth by about 1% at 2021 and by about 2% at 2031. The county-wide impact of strategic and Neighbourhood Plan development in Mid Sussex will, therefore, be slight.
- 6.1.3. Distribution of County trips between travel modes is heavily skewed towards highway vehicles. About 92% of trips are predicted to be by road and only 8% by public transport (bus and rail).
- 6.1.4. In Mid Sussex, the incremental impact of strategic and Neighbourhood Plan development will be in the order of 3,900 highway trips, above the Reference Case, at 2031. Around one third (36%) of highway trips will remain localised within Burgess Hill, whilst the remaining two thirds (64%) will impact upon the wider road network.
- 6.1.5. In the dominant AM peak direction of travel, which comprises trips travelling away from residential sites and trips travelling towards the employment sites, only 25% of Development Case highway movements will remain within Burgess Hill.
- 6.1.6. Overall traffic flows (background plus development traffic) will increase significantly on the following routes (as discussed in section 5.5.10), as a consequence of strategic development in Burgess Hill, together with neighbourhood plan allocations spread across Mid Sussex:
  - A23 southbound, between A272, Bolney and A2300, Hickstead and between A273, Pyecombe and A27, Patcham;
  - A2300 eastbound between A23, Hickstead and A273, Burgess Hill;
  - A272 eastbound and westbound, between A23, Bolney and B2036, Ansty;
  - A273 southbound between Burgess Hill and A23, Pyecombe;
  - A273 northbound between B2036, Burgess Hill and A272, Bolnore;
  - B2036 northbound between A273, Burgess Hill and A272, Ansty; and
  - B2116 westbound between A273, Hassocks and A281, Henfield;
- 6.1.7. Flows will also rise significantly on the following routes within Burgess Hill:
  - B2113 Station Road eastbound and westbound; and
  - Leylands Road / Janes Lane eastbound.
- 6.1.8. The above link flow increases do not necessarily indicate a significant impact from strategic developments in Burgess Hill, or a problem with link performance.

6.1.9. Contribution from strategic sites in Burgess Hill to network traffic volumes is predicted to be substantial (greater than 30%) on the following routes (as described in section 5.4.31):

- B2036, between A273, Fairplace Bridge and A272, Ansty, in Development case (2);
- A2300 eastbound and westbound;
- A272 westbound from B2036, Ansty;
- A273 northbound from B2036, Fairplace Bridge, to A272, Bolnore;
- A273 southbound from B2116, Hassocks, to A23, Pyecombe;
- Janes lane eastbound, in Burgess hill; and
- Northern Arc spine road.

6.1.10. There are a number of highway links on which the addition of substantial traffic, arising specifically from strategic developments in Burgess Hill, will contribute to congestion, as evidenced by a ratio of flow to capacity (RFC) exceeding 100% (noted in section 2.4.32). Critical links are expected to be as follows:

- A2300 eastbound and westbound;
- A272 eastbound, from A273, Bolnore, to B2028, Haywards Heath; and
- No mitigation scheme has, at this stage, been devised to remedy the congestion;
- B2113 westbound, from Keymer Road to Civic Way, in Burgess Hill.

6.1.11. A broader range of road links will experience congestion and stress, (reflected as RFC greater than 100%), as a consequence of overall strategic and neighbourhood plan development trips, (as summarised in section 5.5.22). Mitigation is needed to resolve these congestion problems, which would not arise in the Reference case as strategic and neighbourhood plan developments are absent. The congested links are as follows:

- A2300 eastbound and westbound;
- A272 eastbound, from A273, Bolnore, to B2028, Haywards Heath;
- B2113 westbound, from Junction Road to London Road, in Burgess Hill;
- A277 southbound between A275 and A27, Lewes; and
- A264 eastbound and westbound between A2220, Copthorne and B2028.

6.1.12. Development-related congestion on A2300 and B2113 could probably be resolved by widening the A2300, to dual 2-lane carriageway and by optimising the layout of the A2300 / Northern Arc spine / Business Park junction.

6.1.13. Possible remedial interventions, to mitigate the congestion on A272 (Bolnore to Haywards Heath) and A264 (Copthorne), have not, as yet, been investigated. It is envisaged that these would be tested as part of a preferred package of interventions, in due course.

- 6.1.14. Travel demand associated with the Mid Sussex Development Case (2) (the most realistic mitigation scenario) will have a detrimental impact upon highway network performance at a few critical locations (as noted in section 5.5.25). There are junctions where traffic flows will exceed capacity with development in place, but will be below capacity in the Reference Case, at AM peak 2031. These locations may require some remedial interventions to mitigate junction congestion and are as follows:
- A272 / B2036, Ansty;
  - A272 / A273, Bolnore;
  - A272 / B2028, Haywards Heath;
  - A272 / B2111, Haywards Heath;
  - A272 Paddockhall Road, Haywards Heath;
  - A264 / B2028, near Copthorne;
  - B2114 / B2115 junction, Slough Green; and
  - B2113 Folders Lane / Keymer Road junction, Burgess Hill.
- 6.1.15. There are other junctions at which traffic flows will exceed capacity in the Development Case (2) and in the Reference Case, but where the increment to the RFC contributed by combined development is more than 5%, namely:
- A23 / B2110; Handcross;
  - A23 / A272, Bolney;
  - A23 / B2118 interchange, Sayers Common;
  - A273 / B2112, Clayton;
  - B2112 / Haywards Heath Relief Road Junction;
  - B2110 / B2115, Lower Beeding; and
  - B2110 / B2036.
- 6.1.16. It may be possible to undertake further analysis of MSTS model outputs, in order to identify whether or not strategic development traffic, associated solely with sites in Burgess Hill, is the cause of congestion at the junctions listed above.
- 6.1.17. Two junctions would experience demand in excess of capacity without the mitigation schemes assumed in Development Case (2). These are as follows:
- A273 / B2036 Junction, Fairplace Bridge; and
  - A23 / A2300 Hickstead interchange (85% RFC).
- 6.1.18. There are several potentially congested junctions, where interventions are being considered, to accommodate strategic development, but where an optimum configuration is still to be determined, namely:

- A273 / B2036 Fairplace Bridge – traffic restraint on A273 and B2036 will be needed alongside the new Northern Arc spine road, to alleviate congestion;
  - A2300 / Northern Arc / Business Park junction – a more effective layout and greater capacity, than that of a roundabout with two-lane approaches, will be essential here; and
  - B2112 Haywards Heath Relief Road – a junction arrangement with greater capacity will be needed.
- 6.1.19. The MSTS appraisal suggests that strategic and neighbourhood plan development in Mid Sussex will not give rise to highway performance problems around Ditchling. The B2112, B2116 and Ditchling Beacon Road will show link and junction RFC below 70% in all scenarios at AM peak 2031.
- 6.1.20. Further refinements to the MSTS model assignments are really needed, to ensure that realistic mitigation scheme layouts are included, which will provide adequate capacity for predicted travel demands.
- 6.1.21. Such further remedial interventions and impact mitigation schemes have not been tested at this stage, because agreement is being sought with MSDC and WSCC regarding a preferred package of transport measures to be assessed in a final MSTS model assignment.
- 6.1.22. Impacts from Development Case traffic demand will be negligible in the vicinity of Ashdown Forest, on A275, A22, A26 and B21110. Here, traffic increases will fall well below the 1,000 vehicles AADT threshold increase specified by HRA and, so, will have negligible impact upon air quality.
- 6.1.23. There are strengths and weaknesses to the MSTS approach and outcomes. However, the strategic modelling method has generally provided robust and comprehensive information to inform decision-making by MSDC regarding the District Plan strategy. The study has indicated parts of the transport network where intervention will be critical to ensure that development options are feasible and their impacts are acceptable.
- 6.1.24. The study scope does not allow a detailed picture of development outcomes within Burgess Hill, or a finalised view of what transport interventions will be needed to mitigate development impacts in Mid Sussex. Further work is needed to devise a reliable package of remedial interventions.
- 6.1.25. Once potential interventions have been identified, their effectiveness will need to be assessed for a typical weekday PM peak period as well as for the AM peak referred to throughout this stage 1 report.

## 7. Reliability of the Study Findings

7.1.1. We have considered the robustness and reliability of the findings from the Mid Sussex Transport Study. There is much strength and some weakness in the modelling approach, as discussed below.

### 7.2. Appraisal Strengths

7.2.1. The strategic transport model, as refined for the MSTS, is a strong tool for predicting the area-wide impacts of land use changes, site-specific developments and remedial transport scheme interventions. It represents the main determinants of network performance, namely:

- Base and forecast travel demand, by highway and PT modes and by trip purpose, between origin and destination zones;
- Highway network characteristics, in terms of link distances, speeds and capacities and in terms of junction layouts, capacities and controls;
- PT network, route and service characteristics;
- Transport generalised costs by respective modes; and
- Behavioural decisions, in terms of route choice, mode choice and trip destination choice, as determined by comparative travel costs.

7.2.2. Refinements have been made to the WSCTM, in Burgess Hill, to give greater precision in terms of network, zoning and travel patterns and better accuracy with respect to recently observed (2010) traffic data. This precision is more appropriate than the previous 2008 base model, for the planning proposals being considered by MSDC.

7.2.3. We have used the WSCTM to best effect in assessing the impacts of land use and transport plans proposed by MSDC and WSCC, at AM peak 2031. This has entailed a number of demand scenarios, representing: background growth from NTEM; re-allocation of planning data (households and jobs) between Mid Sussex localities, according to Neighbourhood Plan assumptions; and site-specific trips associated with committed and strategic developments. It has also included several transport intervention packages, representing committed highway and PT improvements and potential schemes to mitigate the impact of future travel demand.

7.2.4. The strategic SATURN / CUBE model has provided a wide range of outputs suitable for making a reliable assessment of the likely impacts of future travel patterns and transport interventions.

### 7.3. Appraisal Weaknesses

- 7.3.1. Any weaknesses in the MSTS appraisal findings are mainly a consequence of a shortage of local detail in the strategic transport model and incompleteness in the scope of work undertaken for the project.
- 7.3.2. Despite refinements, the WSCTM does not include sufficient detail within towns in Mid Sussex, to give a true picture of the following:
  - Shorter-distance travel movements;
  - Access options at development sites;
  - Detailed junction layout and operation;
  - Local PT service arrangements; and
  - Sustainable travel initiatives (e.g. active travel schemes; Smarter Choices and car parking controls).
- 7.3.3. These shortcomings apply in Burgess Hill, Haywards Heath and East Grinstead.
- 7.3.4. MSDC should refer to the forthcoming Burgess Hill Transport Model, to judge the local effects of strategic development at Burgess Hill.
- 7.3.5. The assessments of development impacts and the effects of remedial transport interventions, in the MSTS, are not fully complete. We advise that further model assignments will be needed with revised intervention packages and more refined scheme configurations (e.g. the A2300 / Northern Arc / Business Park access junction), before an optimum judgement on development proposals can be achieved.
- 7.3.6. It is acknowledged that the strategic AM peak modelling appraisal is sufficient to assess the likely transport impacts of the Mid Sussex District Plan. However, if detailed impact analysis is required for specific development sites, then it will be necessary to also consider a PM peak situation.
