Modelling Report 03/03/2020 Page 2

1. INTRODUCTION

1.1 Work Undertaken

- 1.1.1 Mid Sussex District Council (MSDC) commissioned SYSTRA to:
 - Build a strategic highway model to underpin the Mid Sussex Transport Study (MSTS); and
 - Update the Mid Sussex Transport Study to test the impact of proposed development on the strategic and local transport network and upon significant routes in Ashdown Forest (adjacent to but outside of Mid Sussex District).
- 1.1.2 The work is further divided into the following stages:
 - 2017 Base Year Highway Model Production and Validation
 - 2031 Reference Case Scenario;
 - 2031 Sites DPD (Development Plan Documents) Scenario
 - 2031 Sites DPD Scenario including potential mitigation schemes

1.2 Background to the Study

- 1.2.1 The District Plan was submitted to the Secretary of State in August 2016 and adopted on 28th March 2018.
- 1.2.2 The Inspector is satisfied that it is appropriate for the Plan to contain a stepped housing trajectory, taking place after year 2023/24, at 876 dpa for the period up to 2023/24, and subsequently 1,090 dpa to 2031. Effectively this means MSDC have an agreed Plan at 876 dpa for the period to 2023/24 with any subsequent increase primarily subject to the findings of Habitats Regulation Assessment at the higher level of development to assess the transport impact of the Plan on the Ashdown Forest.
- 1.2.3 The additional housing requirement was agreed up to 2031 plan period based on 1,090dpa, subject to further transport modelling work that is required to test the impact of the residual housing requirement on the highway network.

1.3 Highway Model

- 1.3.1 The Mid Sussex Strategic Highway Model (MSSHM) was produced in accordance with standard good practice as set out in the Department for Transport's (DfT) transport analysis guidance (TAG), in particular TAG unit M3-1 Highway Assignment Modelling, (January 2014). As such, the approaches to data processing, matrices and network production, along with model calibration are consistent with those of similar strategic highways models.
- 1.3.2 The model production made appropriate use of existing data and existing models in the area. A very small programme of surveys was undertaken to fill in some gaps in data.

1.4 Transport Study

1.4.1 The impact on the highway network of the agreed Development Scenarios are assessed based on the National Planning Policy Framework (NPPF). The assessment of impacts is based on criteria agreed by MSDC and West Sussex County Council (WSCC). These are

Mid Sussex Transport Study	, ,	
Transport Impact of Sites DPD Scenario	107380	
Modelling Report	03/03/2020	Page 3

derived using WSCC's position statement in relation to the NPPF which sets out their interpretation of terms defining traffic impacts.

- 1.4.2 Where junctions are assessed to be adversely impacted by the developments, mitigation schemes are devised and tested. These mitigations aim to remove all 'severe' impacts.
- 1.4.3 Further parallel work is also being undertaken to:
 - O Undertake environmental impact and road safety impact analysis to comply with National Planning Practice Guidance on transport evidence bases in plan making. This work is undertaken for the *Sites DPD Scenario* as part of the Mid Sussex Transport Study to inform the proposed submission (Regulation 19) Site Allocations Development Plan Documents (DPD).
 - O Undertake air quality modelling and ecological interpretation for Habitats Regulations Assessment to test the impact of traffic, as a result of proposed development, on the Ashdown Forest Special Area of Conservation. This will be based on the outputs of the Mid Sussex Transport Study.

1.5 Scenario's Tested

- 1.5.1 A series of 2031 Development Scenarios have been refined over a number of iterations (reports for Development Scenarios 1 8 are available on the Site Allocations DPD Evidence Library). The *Reference Case* Scenario has also been updated. The *Sites DPD Scenario* represents a refined scenario as part of the Council's plan making process, including sustainability appraisal, to help inform preparation of the Draft Site Allocations DPD and select a preferred option.
- 1.5.2 The *Reference Case* represents the road network in 2031, and includes any committed highway infrastructure, development in the district and background growth to this date. This acts as a baseline when assessing the impacts of the Development Scenarios.
- 1.5.3 The *Sites DPD Scenario* builds on the *Reference* Case and assesses proposed Local Plan development and supporting infrastructure in 2031. It includes:
 - 22 housing development sites (there are 21 additional to the *Reference Case* due to SA24 being committed); and
 - 8 additional employment sites including a science and technology park (subsequently referred to as the S&T park) north of the A2300 near Burgess Hill
- 1.5.4 Where junctions are assessed to be adversely impacted by the developments, a set of appropriate sustainable measures and highway mitigation schemes are proposed and tested. These mitigations aim to remove the 'severe' impacts.
- 1.5.5 The report chapters are:
 - Chapter 1 Introduction
 - O Chapter 2 Scenario Preparation
 - Chapter 3 The Sites DPD Scenario without Mitigation
 - Chapter 4 Proposed Mitigation
 - O Chapter 5 The Sites DPD Scenario with Mitigation
 - Chapter 6 Key Locations
 - Chapter 7 Conclusions
 - Chapter 8 Junction Summaries

Mid Sussex Transport Study

Modelling Report	03/03/2020

2. SCENARIO PREPARATION

2.1 Reference Case Demand Matrices

Key Assumptions

- 2.1.1 This Chapter describes the production of the future year *Reference Case* matrices and network, using the Base model as the starting point. The assumptions for this task are:
 - Reference Case Housing in Mid Sussex District (see Appendix A for detail):
 - O Significant Reference Case Housing in Neighbouring Authorities (Appendix A):
 - Reference Case Employment (Appendix A)
 - Reference Case Infrastructure
 - Trip Rates and Trip Generation
- 2.1.2 The *Reference Case* represents a benchmark against which the development Scenarios are tested and compared. This enables separation of impacts resulting from the Scenario from impacts due to background growth, committed development and infrastructure.

Use of TEMPro

- 2.1.3 Travel demand matrices contain the forecast trips between origin and destination zones across the model study area. Forecasts are based on information obtained from the DfT's National Trip End Model (NTEM), obtained using the Trip End Model Presentation Program (TEMPro). This is compliant with guidance set out in WebTAG (Web-based Transport Assessment Guidance, published by the DfT). The forecasts include:
 - o population
 - employment
 - households by car ownership
 - trip ends
- 2.1.4 TEMPro is designed to allow analysis of pre-processed data from the NTEM. The pre-processed data is itself the output from a series of models developed and run by DfT's Transport Appraisal and Strategic Modelling (TASM) division. TEMPro can also be used to provide summaries of traffic growth using data from the National Transport Model (NTM).
- 2.1.5 For the transport study the trip ends information is used in the form of origin and destination growth factors. These are extracted for 2017-2031 for the AM (0700-1000) and PM (1600-1900) periods, for the locations required.

TEMPro and Site Specific Growth

- 2.1.6 In using TEMPro it is important to be aware of the level of growth that it is applying, and to compare that with the reference case development data that has been provided by the District Council. The data from the district should not simply be added to the TEMPro data as this would lead to double-counting.
- 2.1.7 If committed development data appears to fall short of TEMPro forecasts it is usually considered appropriate to uplift the growth to match TEMPro. Matching to TEMPro provides a consistent benchmark upon which to base Scenario impacts.

Mid Sussex Transport Study		
Transport Impact of Sites DPD Scenario		107380
Modelling Report	-	03/03/2020

- 2.1.8 Comparison between Mid Sussex TEMPro housing forecasts for 2017-2031 and site specific housing reference case data showed they are very similar:
 - Mid Sussex TEMPro housing 2017-2031 = 10789 households
 - Mid Sussex Site Specific Reference Case = 10802 households including Windfall
- 2.1.9 It was therefore agreed that all reference case growth in the District is applied on a site specific basis directly to model zones, in preference to using TEMPro, which is used for growth outside the District only.
- 2.1.10 Growth in **freight** traffic is taken from national road traffic forecasts taken from the National Transport Model (NTM) in accordance with DfT WebTAG guidance.
- 2.1.11 **Windfall sites** are assumed to be 588 units by 2031 distributed pro-rata across the *Reference Case* developments.

2.2 Trip Rates

- 2.2.1 Trip rates are required to calculate trip generations for Mid Sussex developments that are applied directly to an existing model zone or dedicated new model zone.
- 2.2.2 The TRICS (Trip Rate Information Computer System) database is used to calculate origin and destination trip rates for the AM peak, and PM peak hours. They are used to derive the forecast matrices for the *Reference Case* and are shown in **Table 1**; the higher tidal rates are in **bold**. For robustness the 85th percentile is used rather than the mean trip rate for the survey selection.
- 2.2.3 To ensure an adequate sample a minimal number of surveys regarded as not relevant were removed from the analyses. Surveys in the following groups were removed:
 - O Town centre, neighbourhood centre and 'free-standing' developments
 - Saturday surveys
 - All non B1 or B2 (for employment)
 - C1 and C2 (for residential)

Table 1. General Vehicle Trip Rates

USE	CLASS	PARAMETER	AM ORIG	AM DEST	PM ORIG	PM DEST
Private Houses and Flats		dwellings	0.397	0.191	0.143	0.486
Office	B1a	employees	0.043	0.511	0.394	0.021
Research and Development	B1b	employees	0.183	0.367	0.465	0.045
Light Industry	B1c	employees	0.300	0.700	0.844	0.067
Hotel	C1	rooms	0.284	0.104	0.151	0.252

2.3 Sites DPD Scenario Matrices

Key Assumptions

- 2.3.1 The key assumptions are listed below:
 - O Development Locations, Use Class and number of units/employees (Appendix A)
 - Trip Rates and Trip Generation
 - Trip Distribution
 - Development Scenario Infrastructure
 - Development Site Access and Link Roads
- 2.3.2 The *Sites DPD Scenario* trip matrices are prepared for the AM peak and PM peak hours. The trip rates that are derived from TRICS for the committed *Reference Case* developments are used again to calculate trip generations for the development sites.
- 2.3.3 The *Sites DPD Scenario* assesses the impact of an additional 21 housing development sites and 8 employment sites (including the S&T park), compared to the *Reference Case*. **Table** 2 summarises the total housing units considered.

Table 2. Total Housing units Considered in Mid-Sussex in the Sites DPD Scenario

SCENARIO	TOTAL UNITS CONSIDERED	DIFFERENCE
Reference Case excluding Windfall	10,214	-
Reference Case including Windfall	10,802	588
Sites DPD Scenario	12,646	1,844

2.3.4 **Appendix A** provides details of the strategic sites in more detail, including location, units/employees, trip rate and trips generated.

Trip Distribution

2.3.5 The trip distributions are taken from the main model zones that the development is located in or near to and are therefore based on a combination of Census Journey Work 2011 for commuting trips and existing local model matrices.

Mid Sussex Transport Study	
Transport Impact of Sites DPD Scenario	107380
Modelling Report	03/03/2020

2.4 Forecast Matrices Creation Process

2.4.1 The process to prepare the 2031 *Reference Case* and *Sites DPD Scenario* matrices is described below.

Reference Case - Non Mid Sussex Growth (TEMPro)

- 1) Origin and destination trip ends growth factors are extracted from TEMPro for 2017-2031 for the AM (0700-1000) and PM (1600-1900) periods. This is done at the most appropriate level of detail for the model zones, including at the lowest level of disaggregation available (Middle Super Output Area MSOA) for neighbouring areas. Mid Sussex is not included because growth is applied from site specific data.
- 2) TEMPro trip ends by mode are based on the average rates over an area. A mapping exercise is therefore undertaken to calculate appropriate factor for each of the MSSHM zones. This process results in creation of 2017-2031 zonal trip end growth factors for the non- Mid Sussex zones.

Reference Case - Mid Sussex and Neighbouring Authority Site Specific Development

- 3) The site specific data is collated and a mapping exercise is undertaken to apply each development to the appropriate model zone. Larger developments usually have a dedicated new zone added.
- 4) Trip generations are applied using the trip rates described above. This creates trip growth for the zones which is then applied to the 2017 Base matrices in combination with non-Mid Sussex TEMPro growth to produce the 2031 Reference Case matrices.

Sites DPD Scenario - Mid Sussex Growth Site Specific Development

- 5) The site specific Mid Sussex data is collated and a mapping exercise is undertaken to apply each development to the appropriate model zone. Larger developments usually have a dedicated new zone added.
- 6) Trip generations are applied using the trip rates above. This creates trip growth for the Mid Sussex zones which is then applied to the 2031 Reference Case matrices. The applied origin and destination trip generations do not necessarily match, so a furnessing process is required (using the SATURN MX software) to balance these appropriately. This results in the matrices increasing by approximately the average of the origin and destination increases, which is considered appropriate due to the use of 85th percentile trip rates.

2.4.2 The matrix changes are summarised in **Table 3**.

Table 3. Sites DPD Scenario Matrix Sizes and Changes

CCENADIO	AM P	EAK	PM PEAK	
SCENARIO	ORIGINS	DESTS	ORIGINS	DESTS
Reference Case Matrix Total	185,749	185,749	179,361	179,361
Sites DPD Scenario Trips Generations from Trip Rate	1,422	2,239	2,316	1,158
Sites DPD Scenario Furnessed Matrix Total	187,578	187,578	181,116	181,116
Change from Reference Case	1,829	1,829	1,755	1,755

Modelling Report	03/03/2020

2.5 Infrastructure

2.5.1 The dualling of the A2300 is included in the *Reference Case* scenario. The scheme includes the closure of the Bishopstone Lane / A2300 junction for vehicular use. **Table 4** is a summary of infrastructure included in the *Reference Case*.

Table 4. Reference Case Infrastructure

LOCATION			DESCRIPTION
Burgess Hill	A2300		Dualling, and junction improvements
	The Hub	Cuckfield Rd	Roundabout improvements
		Gatehouse Lane	Signal controlled crossing
	East of Kings Way	Junction Road / Silverdale road	Traffic signals
		Valebridge Rd / Janes Lane / Junction Rd	Traffic signals
		Kings Way	Traffic signals
		Church Rd / Mill Rd	Traffic signals
		Keymer Rd	Traffic signals
		Cants Lane	Traffic signals
		Ditchling Common	Speed restrictions
Copthorne	A264	A264 / Brookhill Rd / A220	Roundabout improvements
		Dukes Head Roundabout	Roundabout improvements
Hassocks	Hassocks Stonepound	Stonepound Crossroads	Traffic signals improvements
Haywards Heath	Penland Farm	Hanlye Lane, Borderhill Lane	Roundabout
	Fox Hill	South of Hurstwood Lane	Extension of 30mph speed limit
	Relief Road (east)	Hurstwood Lane	Traffic Signals
	Fox Hill	B2112, Colwell Rd	Roundabout improvements
Crawley	Copthorne	M23 J10	Junction improvements
	Tinsley	Gatwick road	Roundabout improvements
	Pound Hill	A2011	Link road, and junction improvements
	Tinsley	Radford Rd	Traffic signals
	Tinsley Green	Steers Lane / Radford Rd	Traffic signals
		Steers Lane / B2036	Traffic signals
	Hazelwick	A2011	Signalised roundabout
	Fernhill	B2036	Roundabout improvements
	Manor Royal	Gatwick Road	Roundabout improvements
	Cheals Junction	A23	Roundabout slip lane
	Pease Pottage	M23 J11	Signalised gyratory
	Smart Motorways	M23	Motorway improvements

2.5.2 The *Sites DPD Scenario* includes the S&T Park to the north of the A2300, the access to which is via a new roundabout on Cuckfield Road, north of the A2300 / Cuckfield Road roundabout. Improvements at the A2300 / Cuckfield Road roundabout have been included as part of the this development in order to accommodate the large volumes of traffic using this junction in the AM and PM peaks. In the *Sites DPD Scenario*, a hamburger configuration is included at this junction, with a cut-through for traffic staying on the A2300, and signals installed on all approach arms. This has been based on the developer's documents provided.

3. THE SITES DPD SCENARIO WITHOUT MITIGATION

3.1 Introduction to Results

- 3.1.1 This section includes commentary on the outcomes of the *Sites DPD Scenario*, along with numerical analysis using criteria based on interpretation of the National Planning Policy Framework (NPPF). The following sections are:
 - The Sites DPD Scenario without Mitigation
 - Traffic Flow Impacts
 - Impacts on M23 and A23 strategic road network
 - Identification of Junctions with Capacity Impacts
 - Criteria
 - Junctions Identified
 - Proposed Mitigation
 - Sustainable Measures
 - Highway Mitigation
 - O The Sites DPD Scenario with Mitigation
 - Traffic Flow Impacts
 - Impacts on M23 and A23 strategic road network
 - Key Locations Commentary focussing on the A264/A22 at Felbridge
 - Conclusions
 - O Junction Summaries one page summaries for junctions with 'severe' impacts

3.2 Traffic Flow Impacts

- 3.2.1 The Sites DPD Scenario <u>without</u> Mitigation generates significant additional traffic centred around the A2300 and nearby roads, in the AM and PM Peak. The additional demand on the A2300 in particular results in significant rerouting on Cuckfield Road (north and south of the A2300) and the A272 through Ansty. There are also particular impacts on the A273 through Hassocks, B2036, B2116 and B2117.
- 3.2.2 The A23/A2300 dumbbell junction is significantly impacted and in the PM peak traffic is avoiding this junction in favour of alternative routes.
- 3.2.3 In the PM peak, the S&T park traffic appears to be forcing existing traffic to reroute away from the A2300. This is due to heavy flows turning into and out of the park. This impact is less evident in the AM peak. In considering mitigations a priority is for this impact to be alleviated, so that existing A2300 traffic remains on the A2300 and not be forced elsewhere. Keeping traffic on the A2300 may in turn mitigate impacts elsewhere that are currently suffering from the re-routeing.
- 3.2.4 There are also significant flow impacts on the A264, along with rerouting to alternative routes using the B2110 through Turners Hill. This appears to be due to congestion on the A264 particularly at the junction with the A22 at Felbridge.

Mid Sussex Transport Study		
Transport Impact of Sites DPD Scenario	107380	
Modelling Report	03/03/2020	Р

3.3 Impacts on M23 and A23 strategic road network

3.3.1 An approach is devised to identify directional carriageway sections forecast to experience impacts in the future because of the strategic developments. An adaptable criteria representing a 'notable flow increase' is defined as any carriageway section experiencing the following:

Increase in traffic flow of 100 vehicles or more

3.3.2 The impact between the M23 Junction 9 and the A23/A273 at Pyecombe is assessed and the number carriageway sections with a notable flow increase is shown in **Table 5.**

Table 5. Number of M23/A23 carriageway sections identified as having a 'notable flow increase'

SCENARIO	AM	AM	PM	PM
	NORTHBOUND	SOUTHBOUND	NORTHBOUND	SOUTHBOUND
Sites DPD Scenario without Mitigation	1	6	9	0

- 3.3.3 The results show the impact is tidal, the southbound being impacted in the AM and the northbound in the PM. It is considered that this is largely due to the commuting trips to the S&T park. In the AM peak the notable flow increases are confined to the A23, while in the PM peak they extend to the M23. **Appendix B** include these results in more detail.
- 3.3.4 The detailed results show the flow increases are higher in the PM peak, when the most significantly impacted section, in term of traffic flow increase, is between the A272 and the M23 Junction 11 where the increase is up to approximately 13%.

3.4 Identification of Junctions with Capacity Impacts

- 3.4.1 The impact of the Development Scenarios are assessed based on the National Planning Policy Framework (NPPF). The assessment of impacts is based on criteria agreed by MSDC and West Sussex County Council (WSCC). These are derived using WSCC's position statement in relation to the NPPF which sets out their interpretation of terms defining traffic impacts, namely "significant amount of movement" and "severe impacts". In addition, a "showstopper" is defined as a location where the impacts do not have a reasonable prospect of being able to comply with NPPF paragraph 32.
- 3.4.2 An approach is devised to identify locations forecast to experience 'severe' impacts in the future because of the strategic developments.
- 3.4.3 This uses appropriately selected criteria to reflect the interpretation of the NPPF. A 'severe' impact is defined as a junction with any approach arm experiencing either of the following:
 - a junction with an increase in ratio of flow to capacity (RFC) of 10% or more to an RFC of 95% or more in any period in any Scenario; or
 - an increase in average delay of one minute or more to an average delay of two minutes or more in any period in any Scenario
- 3.4.4 A '**significant**' impact is a junction with any approach arm experiencing the following:
 - a junction with an increase in ratio of flow to capacity (RFC) of 5% or more to an RFC of 85% or more in any period in any Scenario

Mid Sussex Transport Study		
Transport Impact of Sites DPD Scenario	107380	
Modelling Report	03/03/2020	Page 11

3.4.5 **Table 6** shows how many junctions are forecast to be impacted significantly or severely in the *Sites DPD Scenario without Mitigation* when compared to the *Reference* Case.

Table 6. 'Severe' and 'Significant' impacts due to Sites DPD Scenario without Mitigation versus Reference Case

SCENARIO	'SEVERE' IMPACTS	'SIGNIFICANT' IMPACTS
Sites DPD Scenario <u>without</u> Mitigation vs Reference Case	9	8

3.4.6 It can be seen that in the *Sites DPD Scenario* <u>without</u> *Mitigation* there are 'severe' impacts at **nine** junctions and 'significant' impacts at **eight** junctions.

'Severe' Junctions

- 3.4.7 The nine junctions with 'severe' impacts are:
 - N7 B2028 Turners Hill Road / Wallage Lane, Crawley Down
 - C7 A272 / B2036, Ansty
 - S1 A23 / A2300 Southbound On-Slip
 - O S2 A23 / A2300 Eastern Roundabout
 - S5 A2300 / Northern Arc Spine Road
 - O S6 Junction Road / B2113, Burgess Hill
 - S8 A273 / B2116 Hassocks (Stonepound)
 - S9 A23 / A281 Eastbound On-Slip, Pyecombe
 - S22 Valebridge Road / Junction Road / Leylands Road, Burgess Hill
- 3.4.8 **Appendix B** shows summary results for the *Sites DPD Scenario* <u>without</u> <u>Mitigation</u>. They include junctions identified in previous Scenarios or in the previous Mid Sussex Transport Study which, for consistency, are retained in the list even if no 'significant' or 'severe' impacts are identified in the *Sites DPD Scenario* <u>without</u> <u>Mitigation</u>. They also contain the results for the Reference Case, compared against the 2017 Base using the same criteria.
- 3.4.9 **Appendix C** shows detailed results for the same junctions, by approach arm. The *Reference* Case results are also provided.
- 3.4.10 **Figure 1** is a map showing the locations of the significant and severely impacted junctions. **Appendix D** shows the map including the full list of junctions. **Appendix E** shows the map including the locations of the *Sites DPD Scenario* development sites.

3.5 Cross Boundary Impacts

- 3.5.1 The junction analysis includes appropriate coverage of neighbouring authorities, the extent of which is defined by the scale and location of the developments. These are:
 - Crawley Borough;
 - Horsham District;
 - Tandridge District;
 - Wealden District; and
 - Lewes District
- 3.5.2 In the *Sites DPD Scenario* <u>without</u> *Mitigation* there are no 'severe' and two 'significantly' impacted junctions outside of Mid Sussex, as follows.
 - S10 B2112 / B2116, Ditchling (Lewes District)
 - S21 B2112 / Green Road, Wivelsfield (Lewes District)

Mid Sussex Transport Study		
Transport Impact of Sites DPD Scenario	107380	
Modelling Report	03/03/2020	Page 12

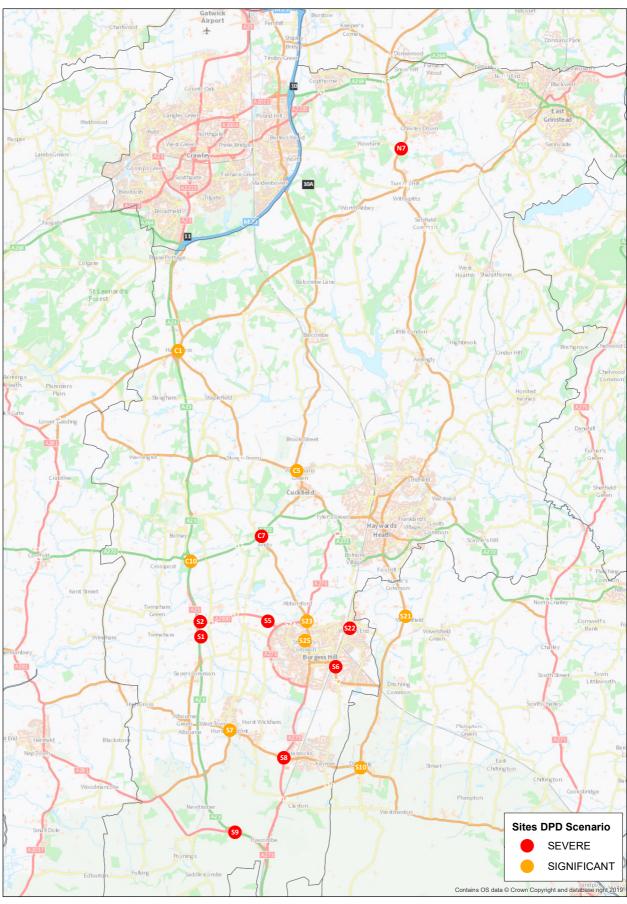

These are both marginal impacts affecting the B2112 southern approach arm in the PM peak only, due to the volume over capacity (V/C) increasing from 87% to 94% at S10 and from 81% to 86% at S21 (see **Appendix C**).

- 3.5.3 The are no 'severe' or 'significant' impacts in any of the other neighbouring authorities.
- 3.5.4 **Appendix B** summarises changes in traffic volumes in terms of total distance travelled (in vehicle kilometres) for the **Ashdown Forest**. It can be seen that compared to the Reference Case the *Sites* DPD *Scenario* <u>without</u> <u>Mitigation</u> results in an increase in vehicle kilometres of 0.52% in the PM peak. In the AM peak there is no discernible change in distance travelled.

4. PROPOSED MITIGATION

4.1 Sustainable Measures

- 4.1.1 Sustainable travel measures are the most effective form of mitigating highway impacts. Sustainable transport, and 'smarter choices' have been considered at each development site, and have been modelled through a reduction of car trips.
- 4.1.2 A set of mitigations is proposed to alleviate the 'severe' impacts identified for *Sites DPD Scenario*. The potential **sustainable mitigations** are proposed in discussion with WSCC and are the measures that can be expected for each site based on location and opportunity for enhancement to bus services and active modes.
- 4.1.3 For the purposes of modelling the sustainable measures are translated to assumed percentage reductions to be applied to the scenario developments only, on a site by site basis as shown in **Table 7**.

Table 7. Sustainable Measures by Development Site

SHLAA ID	Site address	Sites DPD Scenario	Proposed Sustainable Mitigation Improvements	Proposed Car Trip Reduction
127	Land at St. Martin Close, Handcross	65 units	RTI Summary Display on site	1.5%

Modelling Report	03/03/2020	Page 15

4.2 **Highway Mitigation**

- 4.2.1 Highway mitigations are proposed to directly address the 'severe' impacts that cannot be fully removed by sustainable measures alone. Table 8 describes the outline measures that are proposed and tested in the Sites DPD Scenario with mitigation model runs. At this stage of the mitigation process the outline descriptions are sufficient for the purposes of the strategic highway model.
- 4.2.2 To explain the approach in proposing mitigations, it is apparent that some junctions are suffering severe delays, due in part at least, to rerouting away from the A2300 to the A272, A273 through Hassocks, B2036, B2116 and B2117 (including junctions S6, S8, S9 and S22). For these junctions we state 'Full or partial mitigation expected from mitigation at other locations', the focus being to mitigate the A2300, because this will encourage traffic to remain on the main arterial routes and not reroute to rural and residential roads.
- 4.2.3 In proposing mitigation at the A23/A2300 junction at Hickstead (S1/S2), it is apparent from the modelling that in the PM peak the southbound on-slip is unlikely to be able to accommodate significant additional demand without widening of the A23. This is due to the on-slip being opposed by the high tidal flow the A23 southbound experiences in the PM peak, which results in difficulties for traffic merging onto the A23. Further work is required to establish the deliverability of this mitigation improvement.
- 4.2.4 It should be noted that the potential need to provide access for the consented site at Northlands Farm could constrain the proposed free flow mitigation at Hickstead (S2). The status of this site's access requirements should be investigated in further design.

Waste Plan Allocation

- 4.2.5 The West Sussex Waste Local Plan allocates land at Goddards Green, (approximately 5.0 hectares) as acceptable in principle for the development of facilities for the transfer, recycling, and/or recovery of waste. As there is currently no planning application under discussion for the site, the timing of any development remains uncertain. The scale of development to be provided on the site is also flexible and traffic conditions at Hickstead may be a constraint to that. Accordingly this allocation is not included in the Reference Case.
- 4.2.6 The allocation will generate a number of HGV movements during the proposed operating hours of 07:30-18:30 Monday-Friday and 07:30-13.00 Saturday, estimated as between 60 and 240 per day. Generated HGV traffic should be restricted to routing via the A2300 and connecting principal (class A) roads, rather than any use of Cuckfield Road either north of the site access point or to the south of the A2300. This means that the future year base conditions on junctions along the A2300, notably including the roundabouts with the A23 slip roads at Hickstead may have slightly more congested conditions in the future reference conditions, with an estimate of 7-20 additional two-way HGV movements at A2300/A23 in any one hour, subject to any improvement works. A need for modelling at planning application stage is therefore identified.
- 4.2.7 Development of a joint solution with the Science and Technology Park at the impacted junctions (including Hickstead) may enable the future facility, through its own impact assessment, to identify a proportional contribution for the additional traffic movements which it would generate.

5. THE SITES DPD SCENARIO WITH MITIGATION

5.1 Traffic Flow Impacts

5.1.1 The highway mitigations remove the 'severe' impacts on the A23 and A2300, which draws traffic back to these more strategic routes, thereby also removing the 'severe' impacts on the less strategic rural and residential roads to which some traffic had been displaced.

5.2 Performance on M23 and A23 strategic road network

5.2.1 The impact between the M23 Junction 9 and the A23/A273 at Pyecombe is assessed and the number carriageway sections with a notable flow increase is shown in **Table 9.**

Table 9. Number of M23/A23 carriageway sections identified as having a 'notable flow increase'

SCENARIO	AM NORTHBOUND	AM southbound	PM NORTHBOUND	РМ southbound
Sites DPD Scenario	1	6	9	0
Sites DPD Scenario with Mitigation	1	6	9	2

- 5.2.2 Although the number of carriageway sections with a notable flow increase is largely unchanged, the mitigations at the A23/A2300 junction and widening of the A23, as described in **Table 8** result in a releasing of capacity leading to new notable flow increases on **two** A23 southbound sections (PM Peak) from the A2300 on-slip to the B2117. This is shown in more detail in **Appendix B**.
- 5.2.3 The detailed results show the flow increases are higher in the PM peak, when the most significantly impacted section, in term of traffic flow increase, is between the A272 and the M23 Junction 11 where the increase is up to 14%.

5.3 Junctions with Capacity Impacts

5.3.1 **Table 10** shows how many junctions are forecast to be impacted significantly or severely in the *Sites DPD Scenario* with Mitigation when compared to the *Reference* Case.

Table 10. 'Severe' and 'Significant' impacts due to Sites DPD Scenarios versus Reference Case

SCENARIO	'SEVERE'	'SIGNIFICANT'
Sites DPD Scenario <u>without</u> Mitigation versus Reference Case	9	8
Sites DPD Scenario <u>with</u> Mitigation versus Reference Case	1	11

'Severe' Junctions

- 5.3.2 The inclusion of mitigation measures, reduces the number of junctions severely impacted to **one** junction:
 - N7 B2028 Turners Hill Road / Wallage Lane, Crawley Down
- 5.3.3 As stated in **Table 8** the impacted approach arm (Wallage Lane) is a minor road and the 'severe' impact is relatively marginal due to the PM peak volume over capacity (V/C) increasing from 83% to 98% (see **Appendix C**). It is not considered appropriate to undertake junction improvements which could result in facilitating additional through

Mid Sussex Transport Study	i !	
Transport Impact of Sites DPD Scenario	107380	
Modelling Report	03/03/2020 P	Page 18

traffic on Wallage Lane, rather than using more appropriate east-west routes including the A264.

- 5.3.4 Appendices B and C show the summary results and detailed junction results
- 5.3.5 **Figure 2** is a map showing the locations of the significant and severely impacted junctions in the *Sites DPD Scenario* with Mitigation.
- 5.3.6 There is an increase in the number of junctions with a 'significant' impact compared to the <u>without</u> mitigation Scenario. This is largely due to junctions moving from 'severe' to 'significant', while others move from either 'severe' or 'significant' to 'no impact'. However there are two junctions in Burgess Hill that become newly 'significant' having been 'no impact' in the <u>without</u> mitigation Scenario. These are:
 - O S24 A273 Jane Murray Way / Sussex Way
 - S27 B2113 Keymer Road / Folders Lane
- 5.3.7 These secondary impacts are relatively small and result from the mitigation drawing traffic back to the A23/A2300 and the main arterial routes through Burgess Hill, away from roads in residential areas, which is the desired overall outcome. It should be noted that changes in traffic flows will include displaced traffic and is not just confined to development traffic only. Traffic volumes overall are reduced in Burgess Hill in the <u>with</u> mitigation scenario which is beneficial in terms of undesirable rat-running and the associated safety and air quality impacts.
- 5.3.8 It is considered that these and other 'significant' impacts should be addressed using sustainable measures. In addition to the sustainability advantages, this is due to highway mitigations being limited by constraints on land availability within the highway boundary.
- In studying the newly 'significant' impacts at junctions S24 and S27 in more detail, they each occur at one approach arm at each of these junctions. These are the A273 western approach at junction S24 and the Keymer Road southern approach at S27 where, in both cases, the PM peak volume over capacity (V/C) increases to approximately 89% and triggers a 'significant' impact (they both increase to just under 85% in the <u>without</u> mitigation scenario, therefore 'no impact' because the criteria are not triggered).
- 5.3.10 These effects are largely a secondary impact of mitigations elsewhere, particularly on the A2300 and its junction with the A23 at Hickstead. As intended, these mitigations lead to reductions in traffic on routes such as the A273, B2036, B2112 and B2113 as traffic returns to the A23/A2300. However, as part of the balancing of delay across different locations that the model simulates, these reductions in turn release some capacity, resulting in traffic increases on some roads and leading to these small increases in V/C. This effect is more noticeable at roundabouts, where increased flow will also decrease spare capacity and therefore increase the V/C for movements they oppose.

5.4 Cross Boundary Impacts

- 5.4.1 The junction analysis includes appropriate coverage of neighbouring authorities, the extent of which is defined by the scale and location of the developments. In the *Sites DPD Scenario* with Mitigation there are no 'severe' and one 'significantly' impacted junction outside of Mid Sussex, as follows:
 - S21 B2112 / Green Road, Wivelsfield (Lewes District)

Mid Sussex Transport Study		
Transport Impact of Sites DPD Scenario	107380	
Modelling Report	03/03/2020	Page

This is a marginal impact affecting the B2112 southern approach arm in the PM peak only, due to the volume over capacity (V/C) increasing from 81% to 86% (see **Appendix C**).

- 5.4.2 The are no 'severe' or 'significant' impacts in any of the other neighbouring authorities.
- 5.4.3 Appendix B summarises changes in traffic volumes in terms of total distance travelled (in vehicle kilometres) for the Ashdown Forest. It can be seen that compared to the Reference Case the Sites DPD Scenario with Mitigation results in an increase in vehicle kilometres of 0.24% in the PM peak, which is lower the 0.52% increase without mitigation. In the AM peak there remains no discernible change in distance travelled.

Transport Impact of Sites *DPD Scenario*Modelling Report

03/03/2020

Page 21

6. KEY LOCATIONS

A264/A22 Felbridge

- 6.1.1 This signalised junction is currently regarded as a 'hotspot' where delays are experienced. Therefore, it would be reasonable to expect 'severe' conditions in future year scenarios.
- 6.1.2 The A264/A22 junction is not identified as having a severe impacts in the Scenarios. However, it should be noted that this junction is flagged as severe in the *Reference Case*, and operates over capacity; the Scenarios generate slightly more traffic passing through the junction, which increases these impacts further, but not enough to result in severe impacts for the scenarios. Although the nearby developments increase pressure, the model is reporting that the 'severe' conditions are attributable to the *Reference Case* situation rather than the Scenario developments.

Rerouting

- 6.1.3 The highway model allows travellers to change their route due to congestion to achieve the most cost-effective journey possible. It can be seen in the *Reference Case* that significant rerouting is occurring away from the A264/A22 in both the AM and PM peak, and this continues in the Scenarios. The alternative route favoured by the model is via the B2028 and B2110 through Turners Hill. It is mostly trips going to East Grinstead area south of the A22, including Imberhorne Lane that do this.
- 6.1.4 Online route planners suggest that even in current conditions alternative routes on local 'B' roads including those used in the model are viable, and therefore it is reasonable to expect this would happen in reality in 2031.
- 6.1.5 Once the model reaches capacity at a location, delay will increase significantly and extensive rerouting will occur if alternative faster routes are available. Traffic heading to the Imberhorne Lane development from the west will, according to the model, route via the B2110 through Turners Hill, rather than experience the delays on the A264 particularly at the junction with the A22 at Felbridge. Online journey planners suggest this is perhaps already the quicker route in the PM peak for Imberhorne and other destinations south of the A22 in the East Grinstead area.
- 6.1.6 It is apparent that in the PM peak, for journeys from the west to the Imberhorne Lane development, most of the scenario traffic is rerouting from the A264. It is difficult to put an exact figure on this because it varies depending on origin and journey length. The PM peak model shows increases of up to around 150 vehicles on the B2028 through Crawley Down towards Turner's Hill and about 100 additional vehicles travelling east on the B2110 at Turner's Hill towards Imberhorne Lane. This is a mix of traffic relating to the Imberhorne site, the smaller sites in the north of the District and re-routed traffic from the *Reference Case* avoiding the A264. This outcome is similar in the mitigation scenario.

Recommended Further Work

6.1.7 It is considered that to significantly reduce the congestion at this junction and therefore the rerouting in favour of less suitable routes in the *Reference Case* and Scenarios, a significant mitigation of the A264/A22 would be required. To be fully effective this could involve land outside of the WSCC highway boundary, subject to the outcome of more detailed study work.

Mid Sussex Transport Study	 	
Transport Impact of Sites DPD Scenario	107380	
Modelling Report	03/03/2020	Р

7. CONCLUSIONS

The Sites DPD Scenario without Mitigation

- 7.1.1 The Sites DPD Scenario without Mitigation generates significant additional traffic centred around the A2300 and nearby roads, in the AM and PM Peak. This results in significant rerouting on Cuckfield Road and the A272 through Ansty. There are also impacts on the A273 through Hassocks, B2036, B2116 and B2117. The A23/A2300 dumbbell junction is significantly impacted and in the PM peak traffic is avoiding this junction in favour of alternative routes.
- 7.1.2 There are also significant flow impacts on the A264, but these are already prevalent in the Reference Case, resulting in rerouting to alternative routes using the B2110 through Turners Hill. This appears to be mainly due to congestion on the A264 particularly at the junction with the A22 at Felbridge.
- 7.1.3 'Severe' impacts (as defined by the described criteria) occur at **nine** junctions:
 - N7 B2028 Turners Hill Road / Wallage Lane, Crawley Down
 - O C7 A272 / B2036, Ansty
 - O S1 A23 / A2300 Southbound On-Slip
 - O S2 A23 / A2300 Eastern Roundabout
 - S5 A2300 / Northern Arc Spine Road
 - S6 Junction Road / B2113, Burgess Hill
 - S8 A273 / B2116 Hassocks (Stonepound)
 - O S9 A23 / A281 Eastbound On-Slip, Pyecombe
 - S22 Valebridge Road / Junction Road / Leylands Road, Burgess Hill
- 7.1.4 On the M23/A23 the impact is tidal. In the AM peak **six** southbound carriageway sections (all on A23) show an increase of 100 vehicles or more, while in the PM peak **nine** northbound sections (A23 and M23) increase by 100 vehicles or more. The highest percentage increases are up to approximately **13**% on the section between the A272 and M23 Junction 11. It is considered that this is largely attributable to the S&T park.

The Sites DPD Scenario with Mitigation

- 7.1.5 Modelled mitigations include widening of the A23 to three lanes from the A2300 Southbound off-slip to B2118/Mill Lane off-slip and at the eastern Hickstead roundabout a free flow for the A23 southbound off-slip to A2300 eastbound, and partial signalisation.
- 7.1.6 The highway mitigations remove the 'severe' impacts on the A23 and A2300, which draws traffic back to these more strategic routes, thereby also removing the 'severe' impacts on the less strategic rural and residential roads to which some traffic had been displaced.
- 7.1.7 Following mitigation, **one** location remains at 'severe':
 - N7 B2028 Turners Hill Road / Wallage Lane, Crawley Down

The impacted approach arm (Wallage Lane) is a minor road and the 'severe' impact is relatively marginal due to the PM peak volume over capacity (V/C) increasing from 83% to 98% (see **Appendix C**). It is not considered appropriate to undertake junction improvements which could result in facilitating additional through traffic on Wallage Lane, rather than using more appropriate east-west routes including the A264.

Mid Sussex Transport Study	-		
Transport Impact of Sites DPD Scenario		107380	
Modelling Report	-	03/03/2020	1

- 7.1.8 There is an increase in the number of junctions with a 'significant' impact compared to the <u>without</u> mitigation Scenario. This is largely due to junctions moving from 'severe' to 'significant'. However there are two junctions in Burgess Hill that become newly 'significant' having been 'no impact' in the <u>without</u> mitigation Scenario. These impacts are small and result from the mitigation drawing traffic back to the A23/A2300 and the main arterial routes through Burgess Hill, away from roads in residential areas, which is the desired overall outcome.
- 7.1.9 On the M23/A23 the mitigations described above at the A23 and at Hickstead result in a releasing of capacity leading to **two** new PM peak increases of 100 vehicles or more on carriageway sections of the A23 southbound from the A2300 on-slip to the B2117. The highest percentage increases are up to approximately **14**% on the section between the A272 and M23 Junction 11. It is considered that this is largely attributable to the S&T park.

Cross Boundary Impacts

- 7.1.10 The junction analysis includes appropriate coverage of neighbouring authorities, the extent of which is defined by the scale and location of the developments. These are:
 - Crawley Borough;
 - Horsham District;
 - Tandridge District;
 - Wealden District; and
 - Lewes District
- 7.1.11 Outside of Mid Sussex there are no 'severe' and one marginal 'significant' impact in the Sites DPD Scenario <u>with Mitigation</u>:
 - S21 B2112 / Green Road, Wivelsfield (Lewes District)
- 7.1.12 The are no 'severe' or 'significant' impacts in any of the other neighbouring authorities.
- 7.1.13 In the Ashdown Forest, there is an increase in distance travelled (vehicle kilometres) of 0.24% in the PM peak, which is lower the 0.52% increase <u>without</u> mitigation. In the AM peak there is no discernible change in distance travelled.

Transport Impact of Sites DPD Scenario	107380
Madalling Danaut	02/02/2020

N7 B2028 Turners Hill Road / Wallage Lane

Table 11 reports the performance by approach arm for AM and PM peaks, in each modelled Scenario.

Reference Case

The congestion on the A264 / A22 causes rerouting in both the AM and PM peak to alternative routes such as the B2028 and B2110 through Turner's Hill. This causes a number of junctions on these roads to operate at capacity in the *Reference* Case. The Wallage Lane arm of junction N7 is forecast to operate at capacity in the AM peak, with an RFC of 99%, and is forecast to operate close to capacity, 83% in the PM peak. The B2110 Church Road arm of the B2110 Church Road / B2028 Selsfield Road / B2110 East Street junction (N8) is forecast to operate over capacity.

Sites DPD Scenario

The Sites DPD Scenario includes development sites near Turner's Hill as well as in East Grinstead. This increases the amount of traffic rerouting away from the congested A264 / A22 to the B2028 and B2110 compared to the Reference Case. With the B2110 Church Road / B2028 Selsfield Road / B2110 East Street junction (N8) still operating over capacity, this additional traffic is forced to use Wallage Lane, B2027 Turner's Hill Road, and B2110 East Street to access East Grinstead. This increases the traffic on the Wallage Lane arm of the B2028 Turners Hill Road / Wallage Lane junction (N7), causing it to have a forecast capacity increase over 10% in the PM peak, to 98% in the Sites DPD Scenario.

Sites DPD Scenario with Mitigation

When the proposed mitigation is introduced, there are small amounts of rerouting at this junction, however the Wallage Lane arm remains at 'severe'. Wallage Lane is a minor road and the 'severe' impact is marginal. It is not considered appropriate to undertake junction improvements which could result in facilitating additional through traffic on Wallage Lane.

Modelling Report	03/03/2020	Page 26

C7 A272 / B2036, Ansty

The junction performance in the AM and PM peaks for the A272 / B2036 (C7) junction are summarised in Table 12.

Reference Case

The junction is forecast to perform at or over capacity on every arm in the AM peak, and over capacity on A272 eastern and western arms in the PM peak.

Sites DPD Scenario

In the 2031 development scenarios, more traffic is generated by the additional development. This causes more traffic to use the junction, hence increasing RFC and delay on most arms of the junction in AM and PM peaks triggering a severe impact when compared to the *Reference* Case. Due to the junctions location, there is some tidal flow with the A272 eastern arm being forecast to cause a severe impact in the AM period, and the A272 western arm causing a severe impact in the PM peak.

Sites DPD Scenario with Mitigation

At this junction, additional capacity in the form of **flared approaches on the A272 (W) and A272 (E)** have been included, successfully mitigating the junction impacts.

Modelling Report		03/03/2020	ı

S1 A23 / A2300 Southbound On-Slip, Burgess Hill

The forecast performance of the A23 / A2300 southbound on-slip (S1) in Burgess Hill are shown in Table 13.

Reference Case

The A23 southbound operates within capacity on three lane section north of the A2300; the model forecasts that the junction operates close to capacity (RFC of 98%) when the A23 reduces to two lanes, after the A23 southbound off-slip to the A2300. Both the A23 southbound and A23 southbound on-slip operate within capacity in the AM peak.

Sites DPD Scenario

The additional development introduced as part of the 2031 development scenario generates more traffic on the A23 southbound in the PM peak, increasing the RFC to 100%. With the A23 southbound operating at capacity, traffic on the southbound on-slip has difficulty merging onto the A23 southbound. This is reflected in an RFC increase of over 50% in 2031 *Sites* DPD Scenario compared to the *Reference* Case, meaning the junction is severely impacted.

Sites DPD Scenario with Mitigation

At this junction, additional capacity in the form of a A23 widening to three lanes from the A2300 Southbound Off-Slip to the B2118/Mill Lane Off-Slip has been included, successfully mitigating the junction impacts.

S2 A23 / A2300 Eastern Roundabout, Burgess Hill

Table 14 summarises the junction performance of the A23 / A2300 eastern roundabout (S2), in the modelled scenarios.

Reference Case

The model forecasts that the A23 / A2300 eastern roundabout operates within capacity, with RFC's below 80% on all arms, in the AM and PM peaks in the *Reference* Case.

Sites DPD Scenario

When the additional development included in the *Sites DPD Scenario*, more traffic is forecast on the A23 southbound off-slip and A2300 eastern arm of the roundabout in the AM peak. This is primarily driven by traffic travelling to the Science and Technology Park, on the A2300, in the AM peak. The additional traffic causes the junction to be severely impacted, with increases in RFC and delay on these arms.

Sites DPD Scenario with Mitigation

A single free-flow lane from the A23 southbound off-slip to the A2300 (E) arm has been included, alongside reducing the number of approach lanes from two to one on the southbound off-slip. This give-way is also signalised in the same phase as circulating traffic, and traffic from the A2300 (W) approach. The mitigation also includes new traffic signals where the A2300 (E) approach gives way to circulating traffic. The proposed scheme successfully mitigates against the high RFCs and delays at the junction, in both AM and PM peaks.

A2300 / Northern Arc Spine Road, Burgess Hill

Table 15 shows how the performance of the A2300 / Northern Arc Spine Road junction compares in the different modelled scenarios.

Reference Case

S5

The A2300 / Northern Arc Spine Road junction is introduced with the addition of the Northern Arc development in the *Reference* Case scenario. The proposed access takes the form of a four-arm roundabout on the A2300. The model forecasts that the A2300 (W) and southern Northern Arc arms of the junction are approaching capacity in the AM and PM peaks, but the other arms operate within capacity.

Sites DPD Scenario

The Sites DPD Scenario includes the Science and Technology Park, located to the west of this junction. The additional traffic generated by this development increases the volume of traffic on the A2300 as it's the primary access road to and from the Park. This causes a severe impact at the junction compared to the Reference Case, with the A2300 western arm having an increase in RFC exceeding 100% in the PM peak.

Sites DPD Scenario with Mitigation

Additional capacity has been included on the A300 western arm through increasing the length of the proposed flare. This mitigation measure successfully reduces the RFC and delay to a point where the junction is no longer severely impacted.

S6 Junction Road / B2113, Burgess Hill

The junction performance of the Junction Road / B2113 junction (S6) are summarised in Table 16.

Reference Case

The *Reference* Case scenario includes all committed development and infrastructure. This includes the reconfiguration of this junction from a roundabout, to signals. The model forecasts that this junction operates at capacity, with delays in the AM and PM peaks in the *Reference* Case.

Sites DPD Scenario

The additional developments in 2031 *Sites* DPD Scenario increases the traffic passing through this junction, primarily on the B2113 Station Road arm. Although there is some rerouting to avoid it, the increases worsen the performance of the junction enough to cause severe impacts in the AM and PM peaks.

Sites DPD Scenario with Mitigation

Nearby mitigation results in rerouting from this junction, reducing the volume of traffic to a point where it is no longer severely impacted, but is still operating over capacity.

A273 / B2116 Stonepound. Hassocks

Table 17 outlines the junction performance for A273 / B2116 Stonepoound crossroads in the modelled scenarios.

Reference Case

S8

Despite additional capacity being provided as part of the committed highway infrastructure scheme, all arms of the junction operate at, or close to capacity in the *Reference* Case scenario.

Sites DPD Scenario

The additional traffic generated by the developments cause the London Road and Hurst Road arms to be severely impacted in the PM peak.

Sites DPD Scenario with Mitigation

Rerouting, caused by mitigation elsewhere in the network successfully reduces delay on the London Road and Hurst Road arms in the PM peak, to a point where the junction is no longer severely impacted, but is still operating over capacity.

Modelling Report	03/03/2020

S9 A23 / A23 Southbound On-Slip, Pyecombe

Table 18 shows the RFC and delay for each approach arm in each of the modelled scenarios.

Reference Case

As the A23 / A2300 southbound on-slip (S1) shows, the A23 southbound operates at capacity when it reduces to two lanes after the A23 / A2300 southbound off-slip. The capacity constraints continue to Pyecombe, where the model forecasts an RFC of 100% on both the A23, and A23 eastbound on-slip in the PM peak.

Sites DPD Scenario

In the *Sites DPD Scenario*, the additional traffic increases the traffic on the already congested A23 southbound on-slip. The model forecasts that the additional traffic on the A23 southbound on-slip would increase delays on the slip road by 73 seconds in *Sites DPD Scenario*, when compared to *Reference* Case, causing the junction to be severely impacted.

Sites DPD Scenario with Mitigation

The mitigation included elsewhere provides a small amount of relief on the A23 southbound, allowing more traffic to merge from the A23 southbound on-slip to the A23 southbound. This slightly reduces the delay experienced by users on the A23 southbound on-slip, such that the junction is no longer identified as being severely impacted compared to the *Reference* Case.

S22 Valebridge Road / Junction Road / Leylands Road, Burgess Hill

The junction performance of Valebridge Road / Junction Road / Leylands Road in the modelled scenarios is summarised in **Table 19**.

Reference Case

The *Reference* Case includes the committed schemes to convert the Valebridge Road / Junction Road / Leylands Road junction from a mini-roundabout to traffic signals. The Leylands Road arm of the junction is forecast to operate at capacity in the PM peak, with an RFC of 104%.

Sites DPD Scenario

The *Sites DPD Scenario* forecasts that the Leylands Road approach arm is severely impacted compared to the *Reference* Case, in the PM peak. The additional traffic generated by the developments increases the traffic flows on the Leylands Road approach arm, causing the delay to increase by 77 seconds.

Sites DPD Scenario with Mitigation

Traffic reduction from sustainable measures, and highway mitigation measures elsewhere in the network have successfully mitigated the delay on the Leylands Road approach arm such that the junction is no longer identified as having a severe impact compared to the *Reference* Case.
